Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Violation Status:	No violations found

Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS

Map ID	Site	Database(s)	EPA ID Number
	AMOCO 15459 (Continued)		**1000862583**

CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D000
Waste name:	Not Defined
Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D008
Waste name:	LEAD

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D011
Waste name:	SILVER
Violation Status:	No violations found

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No

PENTECOSTAL TEMPLE CHURCH OF GOD (Continued) **1000703753**

Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No

PEP BOYS #891 (Continued) **1004696278**

Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Used oil transporter:	No

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS

SHERWIN WILLIAMS CO (Continued) **1000371369**

CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code:	F004
Waste name:	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: CRESOLS AND CRESYLIC ACID, AND NITROBENZENE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste code:	F005
Waste name:	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste code:	K083

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002

Corrective Action Summary:
Event date: 07/06/1989
Event: RFA Completed, Assessment was an RFA.

Event date: 07/06/1990
Event: RFA Determination Of Need For An RFI, RFI is Necessary;

Event date: 06/06/1991
Event: CA077

Event date: 09/27/1991
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 09/28/1992
Event: CA086

Event date: 07/16/1993
Event: CA016

Event date: 03/31/1994
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 08/28/1997
Event: Current Human Exposures under Control, More information is needed to make a determination.

Event date: 08/28/1997
Event: Igration of Contaminated Groundwater under Control, More information is needed to make a determination.

Event date: 11/06/1997
Event: RFI Imposition, Focused data collection required for stabilization evaluation.

Event date:	12/06/1999
Event:	RFI Approved
Event date:	07/20/2001
Event:	CA005EE
Event date:	08/25/2004
Event:	Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.
Event date:	08/25/2004
Event:	Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

EPA Region: 05
Classification: Small Small Quantity Generator
Description: Handler: generates more than 100 and less than 1000 kg of hazardous waste during any calendar month and accumulates less than 6000 kg of hazardous waste at any time; or generates 100 kg or less of hazardous waste during any calendar month, and accumulates more than 1000 kg of hazardous waste at any time

Owner/Operator Summary:
Owner/operator name: GONNELA BAKING
Owner/operator address: 318 E KENSINGTON
CHICAGO, IL 60628
Owner/operator country: Not reported
Owner/operator telephone: (773) 821-1783
Legal status: Private
Owner/Operator Type: Owner
Owner/Op start date: Not reported
Owner/Op end date: Not reported

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No

GONNELLA BAKING CO (Continued) **1001218857**

Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Violation Status: No violations found

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE

STUART INDUSTRIAL COATINGS INC (Continued) **1000614197**

FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF

SHERWIN WILLIAMS CO (Continued) **1000371369**

LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F004
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: CRESOLS AND CRESYLIC ACID, AND NITROBENZENE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: K083
Waste name: DISTILLATION BOTTOMS FROM ANILINE PRODUCTION

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. Waste code:	LABP
Waste name:	LAB PACK
Waste code:	D000
Waste name:	Not Defined
Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES

SHERWIN WILLIAMS CO (Continued) **1000371369**

WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Biennial Reports:

Last Biennial Reporting Year: 2011

Annual Waste Handled:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Corrective Action Summary:

Event date: 07/06/1989
Event: RFA Completed, Assessment was an RFA.

Event date: 07/06/1990
Event: RFA Determination Of Need For An RFI, RFI is Necessary;

Event date: 06/06/1991
Event: CA077

Event date: 09/27/1991
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 09/28/1992
Event: CA086

SHERWIN WILLIAMS CO (Continued) **1000371369**

Event date: 07/16/1993
Event: CA016

Event date: 03/31/1994
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 08/28/1997
Event: Current Human Exposures under Control, More information is needed to make a determination.

Event date: 08/28/1997
Event: Igration of Contaminated Groundwater under Control, More information is needed to make a determination.

Event date: 11/06/1997
Event: RFI Imposition, Focused data collection required for stabilization evaluation.

Event date: 03/04/1998
Event: RFI Workplan Received

Event date: 03/05/1998
Event: RFI Workplan Received

Event date: 03/26/1998
Event: CA077

Event date: 07/22/1998
Event: CA077

Event date: 10/28/1998
Event: RFI Workplan Approved

Event date: 12/06/1999
Event: RFI Approved

Event date: 07/20/2001
Event: CA005EE

Event date: 08/25/2004
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 08/25/2004
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater

SHERWIN WILLIAMS CO (Continued) **1000371369**

remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Map ID	Site	Database(s)	EPA ID Number

US GEAR CORP/HEAT TREAT CORP (Continued) **1000394164**

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Violation Status:	No violations found

Evaluation Action Summary:

Evaluation date:	09/20/1990
Evaluation:	COMPLIANCE EVALUATION INSPECTION ON-SITE
Area of violation:	Not reported
Date achieved compliance:	Not reported
Evaluation lead agency:	EPA

Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	K062
Waste name:	SPENT PICKLE LIQUOR GENERATED BY STEEL FINISHING OPERATIONS OF FACILITIES WITHIN THE IRON AND STEEL INDUSTRY (SIC CODES 331 AND 332).

Biennial Reports:

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Alias Comments: Not reported
Site Description: Former secondary smelter of non-ferrous metals such as lead and tin. Smelting these metals created bulk units of babbitt and solder. Not currently known if any metal fabrication was done or if cleaning solvents were used on-site. Preliminary XRF data indicates heavy metal contamination on the soil surface throughout the site as well as on flooring of former sturctures. Residential neighborhoods within 1/4 miles of the property.

Hazardous Waste Summary:

Waste code:	D000
Waste name:	Not Defined
Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Violation Status:	No violations found

Description: Handler: generates 100 kg or less of hazardous waste per calendar month, and accumulates 1000 kg or less of hazardous waste at any time;

KEYWELL LLC (Continued) **1004693217**

or generates 1 kg or less of acutely hazardous waste per calendar month, and accumulates at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates at any time: 1 kg or less of acutely hazardous waste; or 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Historical Generators:

Date form received by agency:	03/01/1992
Facility name:	KEYWELL LLC
Site name:	KEYWELL CORP
Classification:	Large Quantity Generator

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Historical Generators:

Date form received by agency:	01/31/1997
Facility name:	AIRGAS SPECIALTY GASES
Site name:	AIR PRODUCTS AND CHEMICALS INC
Classification:	Not a generator, verified

Date form received by agency:	04/01/1985
Facility name:	AIRGAS SPECIALTY GASES
Site name:	AIR PRODUCTS AND CHEMICALS INC
Classification:	Large Quantity Generator

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

LAKE CALUMET SMELTING (Continued) **1007646528**

Alias EPA ID: Not reported
Site FUDS Flag: Not reported

Alias Comments: Not reported
Site Description: Former secondary smelter of non-ferrous metals such as lead and tin. Smelting these metals created bulk units of babbitt and solder. Not currently known if any metal fabrication was done or if cleaning solvents were used on-site. Preliminary XRF data indicates heavy metal contamination on the soil surface throughout the site as well as on flooring of former sturctures. Residential neighborhoods within 1/4 miles of the property.

Hazardous Waste Summary:

Waste code: D001

Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Amount (Lbs): 94163.2

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Hazardous Waste Summary:

Waste code:	D000
Waste name:	Not Defined
Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Violation Status:	No violations found

Historical Generators:

Date form received by agency:	04/28/1995
Facility name:	SMITH TIRE SERVICE
Classification:	Small Quantity Generator

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D003

CARVER MILITARY ACADEMY (Continued) **1001116670**

Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D004
Waste name: ARSENIC

Waste code: D007
Waste name: CHROMIUM

Waste code: D009
Waste name: MERCURY

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Section 4

EPA Waste Code Addendum

SECTION 4 - EPA WASTE CODES

There are no epa codes to report for this search area.

Section 5

Databases Searched and Update Dates

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/30/2012
Date Data Arrived at EDR: 04/05/2012
Date Made Active in Reports: 05/15/2012
Number of Days to Update: 40

Source: EPA
Telephone: N/A
Last EDR Contact: 07/05/2012
Next Scheduled EDR Contact: 10/22/2012
Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 03/30/2012
Date Data Arrived at EDR: 04/05/2012
Date Made Active in Reports: 05/15/2012
Number of Days to Update: 40

Next Scheduled EDR Contact: 10/22/2012
Data Release Frequency: Quarterly

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/27/2011
Date Data Arrived at EDR: 02/27/2012
Date Made Active in Reports: 03/12/2012
Number of Days to Update: 14

Source: EPA
Telephone: 703-412-9810
Last EDR Contact: 07/05/2012
Next Scheduled EDR Contact: 09/10/2012
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 12/28/2011
Date Data Arrived at EDR: 02/27/2012
Date Made Active in Reports: 03/12/2012

Data Release Frequency: Quarterly

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 03/15/2012
Date Data Arrived at EDR: 04/04/2012

Last EDR Contact: 07/02/2012
Next Scheduled EDR Contact: 10/15/2012
Data Release Frequency: Quarterly

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/15/2012
Date Data Arrived at EDR: 04/04/2012

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 12/30/2011	Source: Environmental Protection Agency
Date Data Arrived at EDR: 12/30/2011	Telephone: 703-603-0695
Date Made Active in Reports: 01/10/2012	Last EDR Contact: 06/11/2012
Number of Days to Update: 11	Next Scheduled EDR Contact: 09/24/2012
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 12/30/2011	Source: Environmental Protection Agency
Date Data Arrived at EDR: 12/30/2011	Telephone: 703-603-0695

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/27/2011	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/27/2011	Telephone: 202-566-2777
Date Made Active in Reports: 09/13/2011	Last EDR Contact: 06/25/2012
Number of Days to Update: 78	Next Scheduled EDR Contact: 10/08/2012
	Data Release Frequency: Semi-Annually

BRS: Biennial Reporting System

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/2009	Source: EPA/NTIS
Date Data Arrived at EDR: 03/01/2011	Telephone: 800-424-9346
Date Made Active in Reports: 05/02/2011	Last EDR Contact: 06/01/2012
Number of Days to Update: 62	Next Scheduled EDR Contact: 09/10/2012

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 05/21/2012	Source: Department of Energy & Environmental Protection

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
  Source: National Center for Education Statistics
  Telephone: 202-502-7300
  The National Center for Education Statistics' primary database on private school locations in the United States.
Daycare Centers: Homes & Centers Listing
  Source: Department of Children & Family Services
  Telephone: 312-814-4150

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

EDR Site Report™

EDR® Environmental Data Resources Inc

440 Wheelers Farms Road
Milford, CT 06461
Toll Free: 800.352.0050
www.edrnet.com

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 7

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 1: FACILITY SUMMARY

FACILITY AREA	FACILITY 1 12000 SOUTH EMERALD CHICAGO, IL EDR ID #2003704549
WASTE MANAGEMENT Facility generates hazardous waste (RCRA)	NO
Facility treats, stores, or disposes of hazardous waste on-site (RCRA/TSDF)	NO
Facility has received Notices of Violations (RCRA/VIOL)	NO
Facility has been subject to RCRA administrative actions (RAATS)	NO
Facility has been subject to corrective actions (CORRACTS)	NO
Facility handles PCBs (PADS)	NO
Facility uses radioactive materials (MLTS)	NO
Facility manages registered aboveground storage tanks (AST)	NO
Facility manages registered underground storage tanks (UST)	NO
Facility has reported leaking underground storage tank incidents (LUST)	NO
Facility has reported emergency releases to the soil (ERNS)	**YES - p4**
Facility has reported hazardous material incidents to DOT (HMIRS)	NO
WASTE DISPOSAL Facility is a Superfund Site (NPL)	NO
Facility has a known or suspect abandoned, inactive or uncontrolled hazardous waste site (CERCLIS)	NO
Facility has a reported Superfund Lien on it (LIENS)	NO
Facility is listed as a state hazardous waste site (SHWS)	NO
Facility has disposed of solid waste on-site (SWF/LF)	NO
MULTIMEDIA Facility uses toxic chemicals and has notified EPA under SARA Title III, Section 313 (TRIS)	NO
Facility produces pesticides and has notified EPA under Section 7 of FIFRA (SSTS)	NO
Facility manufactures or imports toxic chemicals on the TSCA list (TSCA)	NO
Facility has inspections under FIFRA, TSCA or EPCRA (FTTS)	NO
Facility is listed in EPA's index system (FINDS)	NO
Facility is listed in a county/local unique database (LOCAL)	NO
POTENTIAL SUPERFUND LIABILITY Facility has a list of potentially responsible parties PRP	NO
TOTAL (YES)	1

Appendix C
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on water resources, including surface and groundwater resources, the local drainage system, water quality, and wetlands. Potential impacts on floodplains are not discussed in this technical memorandum; potential impacts on floodplains will be included in the Draft Environmental Impact Statement (EIS).

The areas of potential impact (APIs) for the water resources evaluation included an area 500 feet on either side of the alternative centerlines; the API is different for each alternative and each alternative option. In order to determine alternative-specific impacts on water resources, existing data on surface and groundwater resources, drainage patterns, water quality, the water supply, and wetlands were reviewed. A field visit was conducted to evaluate potential wetlands.

Lake Michigan is the dominant topographic feature in the region and is approximately 4.8 miles from the RLE alignment at its closest point. Lake Calumet is in the eastern portion of the project area, and the Little Calumet River flows along the southern boundary of the project area. The project area is urbanized and is primarily made up of commercial and residential development. The APIs are in portions of two watersheds: the Chicago/Calumet watershed and the Lake Michigan watershed. The features of all alternatives would be within the Chicago/Calumet watershed. The Lake Michigan watershed is to the east of Union Pacific Railroad (UPRR) Rail Alternative Segment UB; the only portion of the project area that would be in the Lake Michigan watershed is an access road (Illinois River Decision Support System [ILRDSS] 2009). The APIs are not within the Inland Waterway Coastal Zone boundary or a sole source aquifer. The Little Calumet River is on the Illinois 303(d) list of impaired waterways; it is listed as impaired for mercury, polychlorinated biphenyls, aldrin, iron, dissolved oxygen, total phosphorus, and silver (Illinois Environmental Protection Agency [IEPA] 2012b). No Total Maximum Daily Loads (TMDLs) have been developed for this portion of the Little Calumet River. Due to the predominance of impervious surfaces throughout the APIs, minimal percolation to the underlying groundwater occurs.

Potential wetlands were identified at the sites of the Bus Rapid Transit (BRT) Alternative 130th Street park & ride; UPRR Rail Alternative South Station Option and West Station Option; and the 120th Street yard and shop. All sites are highly disturbed and hydrophytic vegetation is present. It is likely that large portions of these sites would be considered wetlands, but not all of the areas may be jurisdictional wetlands subject to regulation. As a basis for impact analysis and to evaluate the maximum potential impact, the following areas (approximate) were considered to be potential wetlands:

- 1.5 to 9 acres of the BRT Alternative 130th Street park & ride site (final impact acreage will be dependent on a formal wetland delineation)

- 14 acres in the vicinity of the UPRR Rail Alternative 120th Street yard and shop location
- 7 acres associated with the UPRR Rail Alternative South Station Option
- 6 acres associated with the UPRR Rail Alternative West Station Option

It is likely that some surface water connections exist between these wetland areas and the Little Calumet River, making some of these areas jurisdictional wetlands. It is more likely that a surface water connection exists from the sites of the BRT Alternative park & ride and UPRR Rail Alternative stations to the river than from the yard site to the river. Due to the highly disturbed topography, a connection would require extensive research and fieldwork to confirm. The fieldwork and formal wetland delineation would take place at the time of the permit application, concurrent with final design.

This analysis identifies maximum potential wetland impacts; formal wetland delineations and confirmation of impacts would be performed following the determination of an environmentally preferred alternative and concurrent with final design. Actual impacts would likely be fewer and/or smaller than the maximum impacts described in this report. Table 1-1 (at the end of this section) summarizes the impacts on water resources including drainage, groundwater, water quality, and wetlands.

The physical modifications associated with the alternatives would result in impacts on the existing stormwater drainage infrastructure, particularly where park & ride facilities would be constructed. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed. Following mitigation, there would be no adverse permanent impacts on stormwater drainage associated with the alternatives.

Mitigation options proposed herein would be confirmed during the design and engineering process in the event that contaminated groundwater was encountered and it was determined that there would be the potential for the contamination to spread. Additional best management practices that would address potential impacts from encountering contaminated groundwater and groundwater dewatering are proposed in the *Hazardous Materials Technical Memorandum*.

There would be no adverse permanent or construction impacts on water quality associated with the alternatives following mitigation. The transit system would replace automobile trips and there would be an associated reduction in roadway pollutants. The introduction of new impervious surfaces would have the potential to increase the concentration and accumulation of runoff contaminants; however, there would be no adverse permanent or construction impacts following mitigation. Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs in the APIs. Therefore, any potential increases in contaminated surface water runoff would have no adverse impact on groundwater quality.

The RLE Project, with compensatory mitigation, either through creation, restoration, enhancement, or preservation of wetlands, would result in no adverse permanent impacts on affected wetlands in the APIs. There are several potential underutilized or vacant industrial land areas, with a connection to the Little Calumet River, that exist within 3 miles of the alternative alignments; these land areas could be restored as compensatory mitigation. Construction staging areas would be sited outside of wetlands as much as possible, but if there were any temporary impacts, those areas would be reconstructed as wetlands following construction.

Development of the BRT Alternative, UPRR Rail Alternative, or Halsted Rail Alternative in combination with related renovation, new construction, and transportation projects identified in the vicinity of the proposed project would not contribute to substantial cumulative water quality, hydrology, and/or drainage impacts.

Updated July 28, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix G of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix G supersedes information presented in other chapters of this technical memorandum.

Table 1-1: Maximum Potential Water Resources Impacts

	Permanent				Construction			
	Drainage	Groundwater	Water Quality	Wetlands	Drainage	Groundwater	Water Quality	Wetlands

BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad, ROW = right-of-way

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed Red Line Extension (RLE) would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
  - Right-of-Way (ROW) Option
  - East Option
  - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which would operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours

of operation for the UPRR Rail Alternative would be the same as for the current Red Line (24 hours every day of the year), and the service frequency is expected to be the same as current service. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation for the Halsted Rail Alternative would be the same as for the current Red Line (24 hours every day of the year), and the service frequency is expected to be the same as current service. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont station.

Section 3
Methods for Impact Evaluation

This analysis included an evaluation of the existing water resources, including wetlands, within an API of 500 feet around each alternative alignment. The analysis also resulted in the identification of proposed best management practices and mitigation measures to avoid, minimize, mitigate, and compensate for adverse impacts. Although floodplain impacts are not analyzed in this technical report, the EIS document reports the results of the floodplain analysis.

3.1 Regulatory Framework

This section describes federal, state, regional, and local regulations and requirements related to water resources.

3.1.1 Federal

3.1.1.1 Clean Water Act (33 United States Code 1251)

The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into waters of the United States and gives the U.S. Environmental Protection Agency (USEPA) the authority to implement pollution control programs and actions, such as setting wastewater standards for industries.

3.1.1.2 Clean Water Act (Section 303(d))

Section 303(d) of the CWA requires states, territories, and authorized tribes to develop a list of water quality-impaired segments of waterways. The 303(d) list includes water bodies that do not meet water quality standards for their specified beneficial uses, even after point sources of pollution have the minimum required levels of pollution control technology. The law requires that jurisdictions establish priority rankings for water bodies on their 303(d) lists and implement a process, called TMDLs, to meet water quality standards.

Section 4 describes the existing condition of waterways and groundwater in the project area, established beneficial uses, and associated TMDLs. These water quality regulations would be applicable during construction and operation of the project alternatives.

3.1.1.3 Clean Water Act (Section 401)

Section 401 of the CWA requires a State Water Quality Certification to show that the proposed project will comply with State water quality standards for any activity that results in a discharge to a water body. In the event that a proposed alternative requires permitting under CWA Section 404 (described below, Section 404 regulates the discharge of dredged or fill material into waters of the United States), a water quality certification is required under CWA Section 401. These regulatory requirements are applicable during construction.

3.1.1.4 Clean Water Act - National Pollution Discharge Elimination System (Section 402)

The National Pollution Discharge Elimination System (NPDES) permit process provides a regulatory mechanism for the control of point source discharges—a municipal or industrial discharge from a specific location or pipe—to surface waters of the United States. Two exceptions that are regulated under the NPDES program are (1) diffuse source discharges caused by general construction that disturb more than 1 acre, and (2) stormwater discharges from municipal stormwater systems that are a separate system in which runoff is carried through a developed conveyance system to specific discharge locations.

The NPDES program regulates pollution generated by runoff from construction, industrial activities, and general and urban land use, including runoff from streets. Federal stormwater regulations require municipalities to obtain NPDES permits for stormwater discharges from municipal storm drains to surface waters. In 1990, USEPA established final regulations for stormwater discharges through the implementation of Section 402(p) of the CWA. The two permits that enforce Section 402(p), the General Industrial Permit and the General Construction Permit, are major attempts to control non-point source pollutants that discharge to local storm drain systems and receiving waters in urban runoff. A General Construction Permit would be required during construction of the proposed alternatives.

3.1.1.5 Clean Water Act (Section 404)

Section 404 of the CWA authorizes the U.S. Army Corps of Engineers (USACE) to issue permits for the discharge of dredged or fill material into waters of the United States, including wetlands (33 United States Code [USC] 1344). The USEPA guidelines (40 Code of Federal Regulations [CFR] 230 et seq.), USACE regulatory guidelines (33 CFR 320 et seq.), and NEPA guidelines (40 CFR 1500 et seq.) are the substantive environmental criteria used to evaluate permit applications submitted to USACE. The USEPA's guidelines suggest a sequential approach to project planning; mitigation measures are considered only after the applicant shows that no practicable alternatives are available to achieve the basic project purpose with a lesser environmental impact. The USACE evaluation of permit applications includes an analysis of practicable alternatives, which is the primary screening mechanism used to determine the appropriateness of permitting a discharge. Section 404(b)(1) guidelines prohibit discharges of dredged or fill material into waters of the United States, including wetlands, if a practicable alternative to the proposed discharge exists that would have less adverse impacts on the aquatic ecosystem (provided that the alternative does not cause other significant adverse environmental impacts) (40 CFR 230[a]).

The 1987 USACE *Wetland Delineation Manual* (USACE 1987) is the current federal delineation manual used in the CWA Section 404 for the identification and delineation of wetlands. The three parameters for defining wetlands are as follows:

- Hydric soils (soils formed under saturation, flooding, or ponding conditions long enough during the growing season to develop anaerobic conditions)

- Wetland hydrology (“areas that are periodically inundated or have soils saturated to the surface at some time during the growing season” [USACE 1987])
- Hydrophytic vegetation (vegetation that thrives in wet conditions)

All three parameters are required “under normal circumstances” for a location to be considered a wetland. Determining whether normal circumstances exist in a disturbed area “involves an evaluation of the extent and relative permanence of the physical alteration of wetland hydrology and hydrophytic vegetation” and consideration of the “purpose and cause of the physical alterations to hydrology and vegetation” (USACE 1987). The Supreme Court refined the requirements for wetlands to be considered jurisdictional based on its 2001 decision *Solid Waste Agency of Northern Cook County v. USACE*, which concluded that a wetland is required to be hydrologically connected to a jurisdictional water of the United States.

3.1.1.6 Rivers and Harbors Appropriation Act of 1899 (33 United States Code 403)

Section 10 of the Rivers and Harbors Act of 1899 (33 USC 403) prohibits the unauthorized obstruction or alteration of any navigable water of the United States. This section provides that the construction of any structure in or over any navigable water of the United States, or the accomplishment of any other work affecting the course, location, condition, or physical capacity of such waters is unlawful unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of the Army. The Secretary of the Army's approval authority has since been delegated to the Chief of Engineers.

3.1.1.7 Sole Source Aquifers (40 Code of Federal Regulations 149)

Sole source aquifer designation is one tool to protect drinking water supplies in areas with few or no alternative sources to the groundwater resource, and where, if contamination occurred, using an alternative source would be extremely expensive. The designation protects an area's groundwater resource by requiring USEPA to review all proposed projects within the designated area that will receive federal financial assistance. All proposed projects receiving federal funds are subject to review, to ensure that the projects do not endanger the groundwater source.

The USEPA defines a sole or principal source aquifer as one that supplies at least 50 percent of the drinking water consumed in the area overlying the aquifer. These areas may have no alternative drinking water source(s) that could physically, legally, and economically supply all those who depend upon the aquifer for drinking water. For convenience, all designated sole or principal source aquifers are referred to as "sole source aquifers."

3.1.1.8 Protection of Wetlands (Executive Order 11990)

Executive Order 11990 directs federal agencies to minimize the destruction, loss, or degradation of wetlands. It also assures the protection, preservation, and enhancement of the nation’s wetlands to the fullest extent practicable during the planning, construction, funding, and operation of transportation facilities and projects.

3.1.1.9 Floodplain Management (Executive Order 11988)

Executive Order 11988 directs federal agencies to avoid conducting, allowing, or supporting actions on a floodplain. The order requires that the federal agency evaluate the potential effects of any actions that it may take in a floodplain.

3.1.2 State

Title 17 of the Illinois Administrative Code covers conservation; Part 3704 covers Regulation of Public Waters. The Division of Water Resource Management (DWRM) of the Illinois Department of Natural Resources (IDNR) issues permits for construction and other activities in public waters of the State. Public waters may generally be described as commercially navigable lakes and streams of the State and the backwater areas of those streams. There are certain public rights in public waters that are reserved for the citizens of the State.

The DWRM reviews proposed activities in public waters to ensure that the public's rights are not diminished by the activity. Activities that require review are not limited to construction. A permit is issued to demonstrate that the activity does not diminish the public's rights. A construction project in public waters may also require review under Parts 3700 (Construction in Floodways of Rivers, Lakes, and Streams), 3702 (Construction and Maintenance of Dams), or 3708 (Floodway Construction in Northeastern Illinois), as well as the Part 3704 rules. A number of common, minor construction activities regulated under Part 3704 are automatically authorized by statewide permits or by Regional Permit No. 3 (Authorizing Construction of Minor Projects in Northeastern Illinois Regulatory Floodways). A permit application submittal to DWRM is not needed for a construction activity that meets the terms and conditions of one or more of these statewide or regional permits.

3.1.2.1 Illinois Coastal Program

The Illinois Coastal Management Program was approved in November 2011. The program defines Inland Waterway Coastal Zone Boundaries, which consist of waterways close to the shore of Lake Michigan and designated land on either side of waterways. These areas are subject to the requirements of the federal Coastal Zone Management Act.

3.1.2.2 Illinois Interagency Wetland Policy Act of 1989

The Illinois Interagency Wetlands Policy Act of 1989 (the Act [20 Illinois Compiled Statues (ILCS) 830 et seq.]) is intended to ensure that there is no overall net loss of the State's existing wetland acres or their functional values resulting from State-supported activities.

The Act charges State agencies with a further duty to "preserve, enhance, and create wetlands where necessary to increase the quality and quantity of the State's wetland resource base" (20 ILCS 830/1-4). The Act uses the same definition for wetlands as defined in the 1987 USACE *Wetland Delineation Manual* used by federal agencies in implementation of the federal CWA.

All three parameters (hydric soils, wetland hydrology, and hydrophytic vegetation) are required for a location to be considered a wetland. However, areas that have been restored or created as the result of mitigation or planned construction projects, and that function as wetlands, are also defined as wetlands under the Act even when all three wetland parameters are not yet present.

3.1.2.3 Illinois Rivers, Lakes, and Streams Act

The Illinois Rivers, Lakes, and Streams Act regulates construction in floodplains and focuses on preserving the hydrological integrity of the State's public waters. There are two separate but similar floodplain regulatory programs established in the Illinois Rivers, Lakes, and Streams Act. One is for the six metropolitan counties in northeastern Illinois: Cook, DuPage, Kane, Lake, McHenry, and Will. The second program is for the rest of Illinois. The purpose of both programs is to "protect the rights, safety, and welfare of private and public landowners by the regulation of floodway development, [because] construction activities which restrict a stream's capacity to carry flood flows may result in channel instability and increased flood damages to neighboring properties" (State of Illinois 1994). The Northeastern Illinois Program requires permits be issued for construction in any regulated floodway.

3.1.3 Local

3.1.3.1 Cook County Watershed Management Ordinance

The Metropolitan Water Reclamation District of Greater Chicago (MWRD) began developing a countywide stormwater management regulatory ordinance to be known as the Cook County Watershed Management Ordinance (WMO) in 2007. The WMO's goal is to establish uniform, minimum, countywide stormwater management regulations. Components that may be regulated under the WMO include drainage and detention, floodplain management, wetland protection, stream habitat and riparian environment protection, soil erosion and sediment control, and water quality.

3.1.3.2 Cook County Stormwater Management Plan

On February 15, 2007, the MWRD's Board of Commissioners adopted the Cook County Stormwater Management Plan (CCSMP) by ordinance. The CCSMP is a high-level organizational plan wherein the overall framework for the countywide program is established and which MWRD is required to adopt as a first step in establishing its countywide stormwater management program. The CCSMP is not a regulatory ordinance and does not set forth any rules, regulations, or standards to which a municipality will be held or be required to enforce.

3.1.3.3 City of Chicago Stormwater Management Ordinance

It is the policy of the City of Chicago to encourage and promote programs with the following goals:

- Minimize the negative stormwater impacts of new development and redevelopment.
- Protect and conserve land and water resources in conjunction with orderly and responsible property development.
- Prevent pollution of local waters, groundwater, and land.

- Minimize stormwater flows into the combined sewer system by minimizing impervious surfaces, promoting infiltration, or discharging to local waters, where appropriate.

- Preserve the natural characteristics of stream corridors in order to moderate flood and stormwater impacts, improve water quality, reduce soil erosion, protect aquatic and riparian habitat, provide recreational opportunities, provide aesthetic benefits, and enhance community and economic development.

- Preserve the natural hydrologic and hydraulic functions of watercourses, floodplains, and wetlands.

- Facilitate existing and future intergovernmental agreements for stormwater management.

- Manage stormwater on the site of a regulated development to the fullest feasible extent.

To achieve these goals, the primary stormwater management objectives for development sites are to (1) reduce impervious areas, (2) capture stormwater on site, and (3) either use or retain the stormwater on-site for evaporation and absorption into the ground. Stormwater that is not used or retained may be discharged into a city-owned combined sewer, storm sewer, or open waterway.

3.1.3.4 Village of Calumet Park

Chapter 151 of the Calumet Park Code of Ordinances regulates Flood Protection and Prevention in order to maintain the "Village's eligibility in the National Flood Insurance Program; to minimize potential losses due to periodic flooding including loss of life, loss of property, health and safety hazards, disruption of commerce and governmental services, extraordinary public expenditures for flood protection and relief, and impairment of the tax base, all of which adversely affect the public health, safety and general welfare; and to preserve and enhance the quality of surface waters, conserve economic and natural values and provide for the wise utilization of water and related land resources" (Village of Calumet Park 2008).

Calumet Park Ordinance 98-712 prohibits the use of groundwater as a potable water supply.

3.2 Impact Analysis Thresholds

While NEPA does not specify federal thresholds of significance for impacts on water resources, it does require that EISs be integrated with the environmental analyses and related surveys and studies required by other federal statutes. Based upon the regulatory framework established by the regulations discussed in Section 3.1, a qualitative evaluation was performed to evaluate potential impacts on water resources.

For the purpose of this EIS, an impact would be adverse if it would do any of the following:

- Violate any applicable water quality standards or waste discharge requirements.

- Affect the rate or change the direction of movement of existing groundwater contaminants, or expand the area affected by contaminants.
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table.
- Substantially alter the existing drainage pattern of the site or area, including the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site.
- Create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.
- Destruction, loss, or degradation of wetlands, including any net loss of their functional values.
- Discharges of dredged or fill material into wetlands.
- Otherwise substantially degrade water quality.

3.3 Area of Potential Impact

The APIs for the water resources evaluation extend 500 feet on either side of the project alternative centerlines; the API is different for each alternative and each alternative option. The RLE alternatives are shown in Figure 2-1. Given that the project would occur in a highly urbanized environment, the effects of construction and operation on water resources would not be expected to extend beyond 500 feet.

3.4 Methods

Existing data sources were reviewed to evaluate potential impacts on water resources. The evaluation of potential wetland impacts included a field reconnaissance to establish the potential presence and condition of wetlands within the project area. The potential permanent and/or construction effects of each alternative on identified water resources were evaluated. Measures to avoid, minimize, mitigate, and compensate for potential adverse impacts were proposed.

3.4.1 Review Existing Data

In order to determine alternative-specific impacts on water resources, existing data on surface and groundwater resources, drainage patterns, water quality, and water supply were reviewed. Existing TMDLs and NPDES permits, which could affect the project, were also reviewed. Information from USEPA Region V was reviewed to determine whether the project area has any sole source aquifers. The APIs were reviewed to determine whether they are within the designated coastal zone.

Existing wetland data was obtained from the U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) and also from the updated coverage prepared by Ducks Unlimited under contract with USFWS. To help locate wetland sites that may have been missed, the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey website was used, where available, to locate areas of potentially hydric soils. The IDNR Ecological Compliance Assessment Tool (EcoCAT) was reviewed to identify resources mapped by IDNR.

3.4.2 Field Review

A general field reconnaissance was conducted to identify potential wetlands within the project area. Aerial photographs were used to evaluate existing mapped wetlands and to help pinpoint potential sensitive areas that may not be included in any of the existing wetland maps or inventories. Potential wetlands within the APIs were evaluated to locate any potential wetland resources intersecting the project area.

The 1987 USACE *Wetland Delineation Manual* was used to determine the presence of wetlands in the project area; the *Wetland Delineation Manual* defines areas as wetland if they meet all three parameters (hydric soils, wetland hydrology, and hydrophytic vegetation). Reconnaissance level wetland assessments were completed and no formal wetland delineations were conducted, although an estimate of wetland size was calculated from aerial photographs after the field review confirmed the presence and extent of wetland areas. Using the USACE manual, each potential wetland site was evaluated for the presence or absence of hydric soils, the dominance of hydrophytic vegetation, and the presence or absence of wetland hydrology.

3.4.3 Impact Analysis

Potential impacts that would be associated with the alternatives were identified, then categorized and analyzed separately based on whether the impacts would be related to permanent activities or construction-period activities. Results of the field survey were used to determine whether wetlands might be present and whether they might be affected within the project area. Wetland resources were described at a reconnaissance level of detail and each alternative was assessed for potential impacts on wetlands within the project area.

Permanent impacts on water resources could result from stormwater runoff, changes in impervious surfaces throughout the APIs (resulting in changes to groundwater infiltration), and surface water and groundwater contamination. Each of these potential permanent impacts was analyzed in relation to applicable permits and regulations.

Construction-related potential impacts on water resources could result from stormwater runoff as well as impacts on the existing drainage infrastructure. Existing water quality conditions and beneficial uses in project area watersheds were assessed. Water quality regulations that would apply to construction of the project alternatives were identified. Each of the alternatives was analyzed for potential construction-related surface water sedimentation impacts generated by erosion and runoff from construction staging areas. Possible groundwater contamination resulting from implementation of the alternatives was considered. Mitigation options were identified to address these potential effects in accordance with applicable NPDES permit requirements and other water resources regulations.

For potential wetlands identified in the API of the NEPA preferred alternative, formal wetland delineations would be performed at the time of permit application submittal, concurrent with final design, to refine the specific area of impacts. The NEPA analysis would support the permit application and review in compliance with wetlands regulations as appropriate. This analysis identifies maximum potential wetland impacts; formal wetland delineations and confirmation of impacts would be performed for the NEPA preferred alternative. Actual impacts would likely be fewer and/or smaller than the maximum impacts described in this report.

Each project alternative was qualitatively assessed for potential impacts on water resources within the project area and recommendations were identified for avoiding and minimizing water resources impacts, as well as potential mitigation measures.

Section 4
Affected Environment

Lake Michigan is the dominant topographic feature in the region and is approximately 4.8 miles from the project area at its closest point near the UPRR Rail Alternative alignment. Lake Calumet is in the eastern portion of the project area, and the Little Calumet River flows along the southern boundary of the project area. The project area is urbanized and is primarily made up of commercial and residential development. Figure 4-1 depicts a regional view of the project area and identifies Lake Calumet and the Little Calumet River.

4.1 Municipal Water Supply/Wastewater Collection

The City of Chicago Department of Water Management is responsible for treating and supplying potable water in the project area. Lake Michigan is the drinking water source for Chicago and its suburbs. Groundwater is not a drinking water source within the project area. The Jardine Water Purification Plant draws raw water from Lake Michigan and serves the northern areas of the City and suburbs, while the South Water Purification Plant draws raw water from Lake Michigan and serves southern areas of the City and suburbs. The Village of Calumet Park also receives water from Lake Michigan.

The MWRD is responsible for wastewater collection and treatment in the project area, including the Village of Calumet Park, which has a combined sewer system to collect both sanitary sewage and stormwater runoff. This agency maintains regional sewer interceptors within the project area.

4.2 Surface Water

4.2.1 Regional Surface Water Setting and Conditions

The APIs are in two watersheds: the Chicago/Calumet watershed and the Lake Michigan watershed. The features of all alternatives would be within the Chicago/Calumet watershed. The Lake Michigan watershed is to the east of Segment UB; the only portion of the project that would be in the Lake Michigan watershed is an access road (ILRDSS 2009).

The Lake Michigan watershed (U.S. Geological Survey [USGS] Cataloging Unit 04040002) lies along the Lake Michigan shoreline, and has a drainage area of about 90 square miles (ILRDSS 2011b). The Chicago/Calumet watershed (USGS Cataloging Unit 07120003) lies directly west of the Lake Michigan watershed, and covers about 580 square miles. Both watersheds are primarily residential and urban, with some forests throughout. The far south of the Chicago/Calumet watershed contains a few agricultural areas (ILRDSS 2011a).

Lake Michigan borders Illinois, Indiana, Michigan, and Wisconsin. It is the second largest Great Lake by volume, with 1,180 cubic miles of water. Lake Michigan is the third largest Great Lake by area.

Figure 4-1: Project Area including Waterbodies

The climate for the project area is typically continental with cold winters and warm summers. The average temperature for the project area is around 52 degrees Fahrenheit (°F), with the average high around 83°F in the summer and the average low around 21°F in the winter. There are about 130 rain days per year (Illinois State Water Survey [ISWS] - Illinois State Climatologist Data 2012). Lake Michigan moderates the regional temperature and causes cooler summers and warmer winters (ISWS - Institute of Natural Resource Sustainability 2012) than other areas of the state. Per the Chicago Climate Change Task Force (2007), peak runoff is predicted to increase and levels in Lake Michigan are likely to decrease. Peak flows in local rivers are expected to increase slightly, increasing the risk of flooding and associated damages.

Local topography typically varies less than 40 feet, with a minimum elevation of 580 feet and a maximum elevation of 620 feet above sea level.

4.2.2 Local Surface Water Setting and Conditions

The alternative alignments would not cross or come in contact with any local water bodies.

The Little Calumet River flows along the southern boundary of the project area. The Little Calumet River flows to the west, away from Lake Michigan. The river flows into the Cal-Sag Channel then into the Chicago Sanitary and Ship Canal, and then into the Des Plaines River.

Lake Calumet is approximately 0.5 mile east of the UPRR Rail Alternative alignment. The lake is owned by the Illinois International Port District and is 8.6 acres in size.

Lake Calumet lies within the Inland Waterway Coastal Zone boundary, but the APIs do not. The inland waterway corridor consists of both the waterway and designated land area on either side of the waterway, and meets the requirements of federal regulations and guidelines for the inclusion within the coastal zone of rivers (waterways), on which uses may have direct impacts on coastal waters (IDNR 2011).

4.2.3 Surface Water Drainage

Storm drains throughout the project area divert water into the Tunnel and Reservoir Plan (TARP), maintained by MWRD. The TARP is a system of deep rock tunnels and surface reservoirs that capture, convey, and store combined sewage during storms until it can be distributed to MWRD's treatment plants as capacity becomes available. The project area is along the Mainstream tunnel of the TARP system (MWRD 2012b). The combined sewers in the Village of Calumet Park carry runoff to the MWRD interceptors. Stormwater runoff exceeding MWRD interceptor capacity is conveyed to the TARP system. In the event of high flows, TARP discharges to the Little Calumet River, which receives discharges from 15 permitted outfalls (MWRD 2012a).

4.3 Groundwater

Groundwater in the project area is in the deep bedrock Cambrian-Ordovician aquifers. Wells drilled into this aquifer range from 800 to 1,500 feet deep. The estimated sustained yield for the Cambrian-Ordovician aquifer system is 65 million gallons per day; by 1979, pumping from this aquifer reached 182.9 million gallons per day. This pumping caused the groundwater levels to drop over 850 feet by 1980. Lake Michigan became a water resource to DuPage, Kane, Lake, McHenry, and Will counties in the early 1980s. Current withdrawals from the Cambrian-Ordovician aquifers are close to the estimated sustainable yield (ISWS - Center for Groundwater Science 2012).

Smaller aquifers overlying the Cambrian-Ordovician aquifers are not widespread and are not utilized for municipal or private water use. Shallow perched groundwater is commonly identified in the Chicago area, though the substrate materials confining the water are characterized as discontinuous lenses and are not laterally continuous. Groundwater generally flows from areas of higher surface elevation to areas of lower surface elevation and toward the nearest surface water body. The flow direction for groundwater underlying the site is assumed to be to the northeast towards Lake Michigan. Localized perched groundwater may flow toward shallower surface water bodies such as Lake Calumet, the Calumet River, or the Little Calumet River.

There are no sole source aquifers in the project area. The closest sole source aquifer is the St. Joseph Aquifer System in northern Indiana, about 70 miles to the east (USEPA Ground Water Branch 2012).

4.4 Water Quality

4.4.1 Surface Water Quality

Urban stormwater runoff from the project area may have negative impacts on surface water quality. Runoff washes residues from the land surface, including deposits from street surfaces, parking surfaces, facility grounds, vehicles, pesticides, and pet waste into the storm drain system.

The Little Calumet River is regulated under the Secondary Contact and Indigenous Aquatic Life Standards. Water bodies regulated under this standard are suited for secondary contact uses and are capable of supporting indigenous aquatic life (IEPA 2012a).

The Little Calumet River is on Illinois 303(d) list of impaired waterways; it is listed as impaired for mercury, polychlorinated biphenyls, aldrin, iron, dissolved oxygen, total phosphorus, and silver (IEPA 2012b). A TMDL analysis has not been developed for this segment of the Little Calumet River system.

4.4.2 Groundwater Quality

The Cambrian-Ordovician aquifers are known to contain high concentrations of naturally occurring barium and radium. The greatest risk for deep aquifer contamination is through contaminant pathways such as abandoned wells; however, vertical migration of chemicals from the land surface poses a low risk of groundwater contamination. Based on information from the Illinois Groundwater Consortium, concentrations of chloride and total dissolved solids have increased in shallow aquifers in the last 20 years (ISWS - Center for Groundwater Science 2012).

4.5 Wetlands

4.5.1 Bus Rapid Transit Alternative

A data review obtained the following about existing conditions within the BRT Alternative API:

- Aerial Photographs

  A review of the aerial photographs confirmed that the API is heavily urbanized and is characterized by paved surfaces and structures (Google Earth 2012). Few, if any, potential wetland areas would be expected to occur in the API based on the review of aerial photographs.

- IDNR EcoCAT

  A review of the IDNR EcoCAT identified no wetlands (IDNR 2012). Appendix A contains the EcoCAT report.

- NRCS Soil

  The NRCS Web Soil Survey website defines four soil types within the BRT Alternative API as hydric soils, as described in Table 4-1 (USDA 2012a, USDA 2012k).

Table 4-1: Hydric Soils within Bus Rapid Transit Alternative Area of Potential Impact

Location	Approximate Distance from Alignment	Soil Type
Southeast quadrant of the intersection of 98th Street and Indiana Avenue	440 feet east	232A
Southwest quadrant of the intersection of 117th Street and Indiana Avenue	Adjacent to the west	2232A
South of the intersection of 130th Street and the UPRR tracks	Adjacent to the south	69A
South of the intersection of 130th Street and Eberhart Avenue, along Eberhart Avenue	Along the alignment	2232A

Notes:
UPRR = Union Pacific Railroad
See references USDA 2012a and USDA 2012k for soil type definitions

Appendix B includes a summary of information from the NRCS Web Soil Survey website.

- NWI

  The NWI classifies several wetland areas within the BRT Alternative API. Updated wetland coverage was confirmed using the Ducks Unlimited web database; data is summarized in Table 4-2 (Ducks Unlimited 2012) and shown on Figure 4-2. Table 4-2 provides the wetland location, approximate distance from the alignment, wetland category, and wetland type.

Wetland categories correspond to the classification nomenclature that best describes the habitat; definitions are included in Appendix C.

Table 4-2: National Wetland Inventory Areas within Bus Rapid Transit Alternative Area of Potential Impact

Location	Approximate Distance from Alignment	Wetland Category	Wetland Type
Little Calumet River	50 feet west	R2UBH	Riverine
Kensington Marsh - north of 130th Street, west of the MWRD facility	350 feet north	LTU2BKh	Wetland Type Not Provided
North of the intersection of 130th Street and Eberhart Avenue, south of the MWRD facility, on the 130th Street park & ride site	On the 130th Street park & ride site	PFO1C	Freshwater Shrub/Forested Wetland
Northeast of the intersection of 130th Street and Eberhart Avenue, south of the MWRD facility, west of the MWRD access road, on the 130th Street park & ride site	On the 130th Street park & ride site	PEM1Ch	Freshwater Emergent Wetland
North of 130th Street and east of the 130th Street park & ride site	130 feet east	PFO1C	Freshwater Forested/Shrub Wetland
North of 130th Street and east of the 130th Street park & ride site	400 feet east	PEM1Ch	Freshwater Emergent Wetland

Notes:
MWRD = Metropolitan Water Reclamation District of Greater Chicago
See reference Ducks Unlimited 2012 for more info on Wetland Types

- Field Visit

A field visit was conducted on August 8, 2012 to look for evidence of potential wetlands within the BRT Alternative API. Wetland resources were evaluated at a reconnaissance level of detail; no formal wetland delineations were conducted. The field reconnaissance found some standing water, indicative of potential wetland areas at the proposed 130th Street park & ride location.

The BRT Alterative 130th Street park & ride site is highly disturbed in both soil and topography. Although hydrophytic vegetation is present, the results of this cursory field investigation were inconclusive. As a basis for impact analysis and to evaluate the maximum potential impact, between approximately 1.5 and 9 acres of the 130th Street park & ride site are considered a potential wetland, dependent on a formal wetland delineation. It is likely that there is a surface water connection between this wetland area and the Little Calumet River, indicating that this is a jurisdictional wetland.

Following the determination of an environmentally preferred alternative and as the design is finalized, a formal wetland delineation would be conducted and the amount and type of impact would be refined. As part of obtaining permits for work on the project, mitigation would be needed if wetlands would be affected. Coordination with the local USACE district is recommended.

4.5.2 Union Pacific Railroad Rail Alternative

4.5.2.1 Segment UA

A data review obtained the following about existing conditions within the UPRR Rail Alternative Segment UA API:

- Aerial Photographs

  A review of the aerial photographs confirmed that most of the API is heavily urbanized and is characterized by paved surfaces and structures (Google Earth 2012). Few, if any, potential wetland areas would be expected to occur in the API in Segment UA.

- IDNR EcoCAT

  A review of the IDNR EcoCAT found no wetlands (IDNR 2012). Appendix A contains the EcoCAT report.

- NRCS Soil

  The NRCS Web Soil Survey website defines one soil type within the UPRR Rail Alternative Segment UA API as hydric soil, as described in Table 4-3 (USDA 2012a, USDA 2012k).

Notes:
See references USDA 2012a, USDA 2012k for more info on soil types

A summary of information from the NRCS Web Soil Survey website is included in Appendix B.

- NWI

  The NWI does not classify any wetland areas within Segment UA of the UPRR Rail Alternative API.

- Field Visit

  A field visit was conducted on August 13, 2012 to look for evidence of potential wetlands along Segment UA of the UPRR Rail Alternative alignment. Wetland resources were evaluated at a reconnaissance level of detail; no formal wetland delineations were conducted. The field reconnaissance found no evidence of potential wetland areas.

4.5.2.2 Segment UB

A data review obtained the following about existing conditions within Segment UB of the UPRR Rail Alternative API:

- Aerial Photographs

  Aerial photographs display potentially sensitive areas east of the Canadian National/Metra Electric crossing along the southern end of the UPRR Rail Alternative API, between the MWRD treatment plant and the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad tracks. A review of the aerial photographs confirmed that most of the API is heavily urbanized and is characterized by paved surfaces and structures (Google Earth 2012). Few, if any, potential wetland areas would be expected to occur in the API other than in the vicinity of the 120th Street yard and shop, South Station Option, and West Station Option.

- IDNR EcoCAT

  A review of the IDNR EcoCAT found no wetlands (IDNR 2012). Appendix A contains the EcoCAT report.

- NRCS Soil

  The NRCS Web Soil Survey website defines two soil types within Segment UB of the UPRR Rail Alternative API as hydric soils, as described in Table 4-4 (USDA 2012a, USDA 2012k).

Table 4-4: Hydric Soils within Segment UB of the Union Pacific Railroad Rail Alternative Area of Potential Impact

Location	Distance from Alignment	Soil Type
Southwest quadrant of the intersection of 117th Street and Indiana Avenue	0 feet	2232A
Kensington Park	70 feet to the southwest	232A

Notes:
See references USDA 2012a, USDA 2012k for more info on soil types

A summary of information from the NRCS Web Soil Survey website is included in Appendix B.

- NWI

  The NWI classifies several wetland areas within Segment UB of the UPRR Rail Alternative API. Updated wetland coverage was confirmed using the Ducks Unlimited web database; data is summarized in Table 4-5 (Ducks Unlimited 2012) and shown on Figure 4-2 in relation to the API. Table 4-5 provides the wetland location, approximate distance from the alignment, wetland category, and wetland type. Wetland categories correspond to the classification nomenclature that best describes the habitat; definitions are included in Appendix C. The MWRD drying ponds, which are within the API, are classified as freshwater ponds.

Table 4-5: National Wetland Inventory Areas within Segment UB of the Union Pacific Railroad Rail Alternative Area of Potential Impact

Location	Approximate Distance from Alignment	Wetland Category	Wetland Type
Five MWRD drying ponds	75-200 feet west	PUBKh	Freshwater Ponds
West of UPRR Rail Alternative, south of yard, north of South Station Option site	180 feet west	PUBGx	Freshwater Pond
Along South Station Option site, north of 130th Street	0 feet	PEM1Kh	Freshwater Forested/Shrub Wetland
West of South Station Option site, north of 130th Street	58 feet west	PUBKh	Freshwater Pond
Along West Station Option site, north of 130th Street	0 feet	PEM1Kh	Freshwater Forested/Shrub Wetland
Along West Station Option site, north of 130th Street	0 feet	PEM1Ch	Freshwater Emergent Wetland
North of West Station Option site, north of 130th Street	100 feet north	PUBKh	Freshwater Pond

Location	Approximate Distance from Alignment	Wetland Category	Wetland Type
Along West Station Option site, north of 130th Street	0 feet	PFO1C	Freshwater Forested/Shrub Wetland
West of West Station Option site, north of 130th Street	25 feet west	PEM1Ch	Freshwater Emergent Wetland
West of West Station Option site, north of 130th Street	415 feet west	PFO1C	Freshwater Forested/Shrub Wetland

Notes:
MWRD = Metropolitan Water Reclamation District of Greater Chicago, UPRR = Union Pacific Railroad
See reference Ducks Unlimited 2012 for more info on wetland types

- Field Visit

A field visit was conducted on August 13, 2012 to look for evidence of potential wetlands along the UPRR Rail Alternative alignment. The field visit focused on the area along the southern end of the UPRR Rail Alternative alignment, in Segment UB, from the Canadian National/Metra Electric crossing to 130th Street, as shown in Figure 4-3. Wetland resources were evaluated at a reconnaissance level of detail; no formal wetland delineations were conducted. During the site visit, notes regarding potential wetland hydrology, soils, and vegetation were collected. Soils within four hand-dug test pits were evaluated for hydric characteristics. Test pits were dug at representative locations where there appeared to be differences in the vegetation, topography, or soils. Several test pits were dug in an attempt to identify variations in soils that could be useful in differentiating between wetland and non-wetland areas. Test pit locations (Figure 4-3) were in the vicinity of the 120th Street yard and shop. Appendix D contains photographs from the field visit.

The area in the vicinity of the 120th Street yard and shop is highly disturbed. The area is characterized by a young cottonwood forest with pockets of phragmites. At the time of the field visit, the cottonwoods were generally 6 inches in diameter. Based on historical aerial photos (Google Earth 1998, 2002, 2004, 2005, 2007, 2008, 2009, 2010, 2011, 2012), the area to the southwest of the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad train tracks began to become forested around 2005/2007 (Google Earth 2012). Table 4-6 summarizes the plants identified throughout the area.

Figure 4-3: Field Survey Area and Test Pit Locations

Table 4-6: Plants Identified in the Union Pacific Railroad Rail Alternative Area of Potential Impact

Scientific Name	Common Name	Wetland Indicator Status
Acer negundo	boxelder	FACW-
Daucus carota	Queen Anne's lace	--
Phragmites australis	common reed	FACW+
Populous deltoides	eastern cottonwood	FAC+
Prunus virginiana	chokecherry	FAC-
Rhamnus cathartica	common buckthorn	FACU
Rhus typhina	staghorn sumac	--
Ulmus americana	American elm	FACW

Notes:

- **FACW** = Facultative Wetland (usually occurs in wetlands but occasionally found in non-wetland), **FAC** = Facultative (equally likely to occur in wetlands or non-wetlands)**, FACU** = Facultative Upland (usually occurs in non-wetlands, but occasionally found on wetlands)
- A positive (+) or negative (-) sign more specifically defines the regional frequency of occurrence in wetlands.
- References: USDA 2012b, USDA 2012c, USDA 2012d, USDA 2012e, USDA 2012f, USDA 2012g, USDA 2012h, USDA 2012i, USDA 2012j

The soils appeared to be highly disturbed and likely include material imported from other locations. Railroad ties and potential slag were identified throughout the area. Four test pits were hand dug (using a shovel) to evaluate for hydric soil characteristics. Figure 4-2 shows the test pit locations. The evaluated soils appeared to be imported fill; the soil was heavily compacted shortly below the ground surface. Test pits TP-1, TP-2, and TP-3 showed similar dark, organic soils with unnatural objects, including slag. From 0 to 8 inches below grade, test pit TP-4 had organic soils; from 8 inches to the bottom of the text pit was sand with red features. Data collected from the test pits is presented in Appendix E and summarized in Table 4-7.

Table 4-7: August 2012 Field Visit Summary

Test Pit	Hydrophytic Vegetation Present?	Wetland Hydrology Present?	Hydric Soil Present?
TP-1	Yes	Unknown	No
TP-2	Yes	Unknown	No
TP-3	Yes	Unknown	Yes
TP-4	Yes	Unknown	No

The 2012 January–August period was the warmest and fourth driest on record in Illinois. During January–August 2012, statewide average precipitation was a total of 17.5 inches, 7.3 inches below normal. The statewide average temperature during January–August was 59.0°F, 4.2°F above normal (ISWS - Prairie Research Institute 2012). These unusually dry conditions may have contributed to the lack of evident signs of seepage, springs, or ponding visible during the field survey of the 120th Street yard and shop location; however, it is possible that the soil could be saturated to the surface during the spring. The area surveyed has flat topography; there were no obvious drainages and there were depressions where there was some standing water. The flat topography, combined with the highly compacted soils, likely holds water at the surface for the required two weeks in the spring growing season, leading to the preponderance of wetland vegetation observed.

Both the South Station Option and West Station Option terminal locations include a drainage ditch (along the north side of 130th Street, south of the MWRD facility); phragmites were identified in the drainage ditch.

The soils and topography of the 120th Street yard and shop site, the South Station Option site, and the West Station Option site are all highly disturbed. Although the vegetation is predominantly hydrophytic, the results of this cursory field investigation were inconclusive. As a basis for impact analysis and to evaluate the maximum potential impact, approximately 14 acres in the vicinity of the 120th Street yard and shop, 7 acres associated with the South Station Option, and 6 acres associated with the West Station Option are considered potential wetlands. It is likely that there is a surface water connection between these wetland areas and the Little Calumet River, making these jurisdictional wetlands. It is more likely that a surface water connection exists from the proposed stations to the river than from the yard site to the river, but due to the highly disturbed topography a connection would require extensive research and fieldwork to confirm. The fieldwork would take place at the time of the permit application, concurrent with final design.

This analysis identifies maximum potential wetland impacts; formal wetland delineations and confirmation of impacts would be performed for the NEPA preferred alternative. Actual impacts would likely be fewer and/or smaller than the maximum impacts described in this report. As part of obtaining permits for work on the project, mitigation would be needed. Coordination with the local USACE district is recommended.

4.5.3 Halsted Rail Alternative

4.5.3.1 Segment HA

A data review obtained the following information about existing conditions within Segment HA of the Halsted Rail Alternative API:

- Aerial Photographs

  A review of the aerial photographs confirmed that the Halsted Rail Alternative API is heavily urbanized and is characterized by paved surfaces and structures (Google Earth 2012). Few, if any, potential wetland areas would be expected to occur in the API based on the review of aerial photographs.

- IDNR EcoCAT

  A review of the IDNR EcoCAT identified no wetlands in Segment HA of the Halsted Rail Alternative API (IDNR 2012). Appendix A contains the EcoCAT report.

- NRCS Soil

  The NRCS Web Soil Survey website defines no soil types within the Halsted Rail Alternative API as hydric soils (USDA 2012a, USDA 2012k). Sites containing soils classified as "not hydric" are unlikely to contain wetlands. Appendix B contains a summary of information from the NRCS Web Soil Survey website.

- NWI

  The NWI classifies no wetland areas within Segment HA of the Halsted Rail Alternative API.

- Field Visit

  A field visit was conducted on August 13, 2012 to look for evidence of potential wetlands within the Halsted Rail Alternative API. Wetland resources were evaluated at a reconnaissance level of detail and no formal wetland delineations were conducted. The field reconnaissance found no evidence of potential wetland areas.

  The USACE *Wetland Delineation Manual* defines areas as wetland if they meet all three parameters (hydric soils, wetland hydrology, and hydrophytic vegetation). No areas along the Halsted Rail Alternative Segment HA would be considered a wetland according to this definition.

4.5.3.2 Segment HB

A data review obtained the following information about existing conditions within Segment HB of the Halsted Rail Alternative API:

- Aerial Photographs

  A review of the aerial photographs confirmed that the Halsted Rail Alternative API is heavily urbanized and is characterized by paved surfaces and structures (Google Earth 2012). Few, if any, potential wetland areas would be expected to occur in the API based on the review of aerial photographs.

- IDNR EcoCAT

  A review of the IDNR EcoCAT identified the Riverdale Marsh within the vicinity of the southern end of the Halsted Rail Alternative alignment (IDNR 2012). No other wetlands were identified in Segment HB of the Halsted Rail Alternative API. Appendix A contains the EcoCAT report.

- NRCS Soil

  The NRCS Web Soil Survey website defines no soil types within the Halsted Rail Alternative API as hydric soils (USDA 2012a, USDA 2012k). Sites containing soils classified as "not hydric" are unlikely to contain wetlands. Appendix B contains a summary of information from the NRCS Web Soil Survey website.

- NWI

  The NWI classifies two wetland areas within the Halsted Rail Alternative API. Updated wetland coverage was confirmed using the Ducks Unlimited web database; the data is summarized in Table 4-8 (Ducks Unlimited 2012) and shown on Figure 4-2. Table 4-8 provides the wetland location, approximate distance from the alignment, wetland category, and wetland type. Wetland categories correspond to the classification nomenclature that best describes the habitat; definitions are included in Appendix C.

Table 4-8: National Wetland Inventory Areas within Halsted Rail Alternative Area of Potential Impact

Location	Approximate Distance from Alignment	Wetland Category	Wetland Type
Northwest of intersection of 125th Street and Halsted Avenue, in Cedar Park Cemetery	120 feet west	PUBGx	Freshwater Pond
Little Calumet River	100 feet south	R2UBH	Riverine

Notes:
See reference Ducks Unlimited 2012 for more information on wetland types

- Field Visit

  A field visit was conducted on August 13, 2012 to look for evidence of potential wetlands within the Halsted Rail Alternative API. Wetland resources were evaluated at a reconnaissance level of detail and no formal wetland delineations were conducted. The field reconnaissance found no evidence of potential wetland areas.

  The USACE *Wetland Delineation Manual* defines areas as wetland if they meet all three parameters (hydric soils, wetland hydrology, and hydrophytic vegetation). No areas along the Halsted Rail Alternative Segment HB would be considered a wetland according to this definition.

4.6 Floodplains

There are no floodplains in the APIs; see map in Appendix F.

Section 5
Impacts and Mitigation

5.1 No Build Alternative

The No Build Alternative represents existing conditions for water resources in the project area.

5.1.1 Permanent Impacts and Mitigation - No Build Alternative

It is anticipated that there would be no permanent impacts on water resources as a result of the No Build Alternative.

5.1.2 Construction Impacts and Mitigation - No Build Alternative

It is anticipated that there would be no construction impacts on water resources as a result of the No Build Alternative.

5.2 Bus Rapid Transit Alternative

5.2.1 Permanent Impacts and Mitigation - Bus Rapid Transit Alternative

5.2.1.1 Drainage Impacts

The physical modifications associated with the BRT Alternative would result in impacts on the existing stormwater drainage infrastructure, particularly where park & ride facilities would be constructed. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed. There would be no adverse permanent impacts on stormwater drainage associated with the BRT Alternative.

With the exception of the park & ride facilities at 102nd Street and 130th Street, proposed construction would take place on already impervious land, and therefore would not substantially increase the amount or peak flow rate of stormwater runoff entering the storm drain system. The decrease in pervious area in the vicinity of the 102nd Street and 130th Street park & ride facilities could be mitigated by incorporating new stormwater management structures.

An additional potential mitigation measure to protect water resources is listed below.

- Establishing an erosion control plan prior to the initiation of construction. The erosion control plan could include the following:
    - Use of natural drainage, detention ponds, sediment ponds, or infiltration pits to allow runoff to collect and reduce or prevent erosion
    - Use of barriers to direct and slow the rate of runoff and to filter out large-sized sediments
    - Use of down-drains or chutes to carry runoff from the top of a slope to the bottom

5.2.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the BRT Alternative.

5.2.1.3 Water Quality Impacts

There would be no adverse permanent water quality impacts associated with the BRT Alternative. The BRT Alternative would supplement the existing #34 bus route along Michigan Avenue; the transit system would replace automobile trips and there would be an associated reduction in roadway pollutants. There would be a minimal change from existing conditions in the buildup of typical runoff contaminants that collect on streets (i.e., oil, grease, and metals).

The introduction of new impervious surfaces resulting from the construction of park & ride facilities associated with the BRT Alternative would have the potential to increase the concentration and accumulation of runoff contaminants. Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs in the API. Therefore, any potential increases in contaminated surface water runoff would have no adverse impact on groundwater quality.

Potential impacts on water resources stemming from both construction and operation could be mitigated with the following measures as appropriate:

- Project design that includes properly designed and maintained biological oil and grease removal systems in new storm drain systems to treat water before it leaves project construction areas
- Proper storage of hazardous materials to prevent contact with precipitation and runoff
- Development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials
- Placement of equipment to be repaired or maintained in covered areas on a pad of absorbent material to contain leaks, spills, or small discharges
- Periodic and consistent removal of landscape and construction debris
- Removal of any significant chemical residue on the project sites through appropriate methods
- Use of non-toxic alternatives for any necessary applications of herbicides or fertilizers
- Installation of detention basins or other landscaping features to remove suspended solids by settlement
- Periodic monitoring of runoff water quality before discharge from the site and into the storm drainage system

5.2.1.4 Wetland Impacts

The BRT Alternative park & ride facility could affect between 1.5 and 9 acres of wetlands, dependent on a formal wetland delineation. Following compensatory mitigation, either through creation, restoration, enhancement, or preservation of wetlands, the BRT Alternative would have no adverse permanent impacts on wetlands in the API. Compensatory mitigation is regulated under the 2008 CWA Section 404 Final Compensatory Mitigation Rule and is intended to replace lost aquatic resource functions and area with the goal of "no net loss" of wetlands (USEPA 2008). Compensatory mitigation should take place on public or private land at or adjacent to the impact site or at another location generally within the same watershed where it is most likely to replace lost functions. There are several potential underutilized or vacant industrial land areas, with a connection to the Little Calumet River, that exist within 3 miles of the alignment; these land areas could be restored as compensatory mitigation.

5.2.2 Construction Impacts and Mitigation - Bus Rapid Transit Alternative

5.2.2.1 Drainage Impacts

The physical modifications associated with the BRT Alternative would result in potential impacts on the existing stormwater drainage infrastructure, particularly where park & ride lots and structures would be constructed. These alterations would not greatly affect the direction or volume of drainage through the API. In areas where construction could result in the need to relocate certain drainage infrastructure, temporary lines would be installed during the construction period.

In addition to the mitigation measures recommended in Section 5.2.1.1, controlled use of water for irrigation and dust control is also recommended to avoid off-site runoff.

5.2.2.2 Groundwater Impacts

There would be a potential need for dewatering by removing groundwater from the construction site by pumping if groundwater were encountered during construction. Dewatering during construction could temporarily affect local shallow groundwater levels. Given the likelihood of encountering contaminated groundwater, compliance with federal, state, and local laws and regulations (as described in the *Hazardous Materials Technical Memorandum*) would be required during construction.

5.2.2.3 Water Quality Impacts

Water quality impacts could result from construction of the BRT Alternative. Construction would have the potential to increase erosion and sedimentation around proposed construction and staging areas. Grading associated with construction could result in a temporary increase in the amount of suspended solids in stormwater running off construction sites. In the case of a storm event, construction site runoff would result in sheet erosion of exposed soil. If not adequately controlled, contaminated runoff from these areas would have the potential to degrade surface water quality.

The impacts of construction of the BRT Alternative on water quality would be minor because the project area is already highly urbanized. In order to ensure that surface water runoff would not have adverse impacts on water quality, human health, or safety, appropriate measures would be taken to control runoff during implementation. Some examples of these mitigation measures include establishing an erosion control plan, ensuring the proper storage and handling of hazardous materials including paints, solvents, fuels, and hydraulic fluids, and periodic monitoring of the water quality of runoff leaving the site. Section 5.2.1.3 summarizes proposed mitigation measures.

5.2.2.4 Wetland Impacts

Compensatory mitigation would be needed for construction related, temporary impacts on wetlands. Construction staging areas would be sited outside of wetlands as much as possible, but if there were any temporary impacts, those areas would be reconstructed as wetlands following construction.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1 Permanent Impacts and Mitigation - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1.1 Segment UA

5.3.1.1.1 Drainage Impacts

The physical modifications associated with the UPRR Rail Alternative ROW Option would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

Much of the proposed construction would take place on already impervious land and therefore would not significantly increase the amount or peak flow rate of stormwater runoff entering the storm drain system. Pervious area is anticipated to decrease in the following areas under the ROW Option: along I-57, through the northwest corner of Wendell Smith Park and across the UPRR ROW to the west of Wendell Smith Park, around stations, and at the park & ride facilities and substations. The decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation, there would be no adverse permanent stormwater drainage impacts associated with the UPRR Rail Alternative ROW Option.

The Roseland Pump Station is east of the UPRR Rail Alternative ROW Option at 104th Street. The Roseland Pump Station is a major water distribution facility supplying water to the City of Chicago and surrounding suburbs. There are underground pipes and structures running west from the pump station. Other major underground pipes and structures include the 10-foot-diameter Stewart Avenue water tunnel, the 10-foot-diameter sewer underneath Wentworth

Avenue near 114th Street, and the 17.5-foot, horseshoe-shaped MWRD Calumet Intercepting Sewer tunnel. Stormwater drainage and water structures would need to be designed to accommodate the pump station and other underground utilities.

Section 5.2.1.1 summarizes proposed mitigation measures.

5.3.1.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the UPRR Rail Alternative ROW Option.

5.3.1.1.3 Water Quality Impacts

The operation of the Red Line under the ROW Option would replace automobile trips; there would be an associated reduction in runoff contaminants that collect on streets (i.e., oil, grease, and metals). For this reason, the ROW Option is anticipated to have a minor but positive water quality impact.

The introduction of new impervious surfaces would have the potential to increase the concentration and accumulation of runoff contaminants. Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs in the API. Therefore, any potential increases in contaminated surface water runoff would have no adverse impact on groundwater quality.

After mitigation, there would be no adverse permanent water quality impacts associated with the UPRR Rail Alternative ROW Option. Section 5.2.1.3 summarizes proposed mitigation measures.

5.3.1.1.4 Wetland Impacts

Because there are no wetlands in Segment UA of the UPRR Rail Alternative, there would be no permanent impacts on wetlands.

5.3.1.2 Segment UB

5.3.1.2.1 Drainage Impacts

The physical modifications associated with the UPRR Rail Alternative ROW Option would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

Much of the proposed construction would take place on already impervious land and therefore would not substantially increase the amount or peak flow rate of stormwater runoff entering the storm drain system. Pervious area is anticipated to decrease in the following areas under the ROW Option: around stations, at the park & ride facilities, and from north of Kensington Park where the UPRR Rail Alternative splits from the existing UPRR tracks through the southern end of the UPRR Rail Alternative, including both terminal options. The decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation, there would be no adverse permanent stormwater drainage impacts associated with the UPRR Rail Alternative ROW Option. Section 5.2.1.1 summarizes proposed mitigation measures.

5.3.1.2.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the UPRR Rail Alternative ROW Option.

5.3.1.2.3 Water Quality Impacts

See Section 5.3.1.1.3.

5.3.1.2.4 Wetland Impacts

The UPRR Rail Alternative ROW Option South Station Option and West Station Option facilities could affect approximately 7 and 6 acres of wetlands, respectively. Following compensatory mitigation these options would have no adverse permanent impacts on wetlands in the API. Section 5.2.1.4 discusses compensatory mitigation.

5.3.2 Construction Impacts and Mitigation - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.2.1 Segment UA

5.3.2.1.1 Drainage Impacts

The physical modifications associated with the UPRR Rail Alternative ROW Option would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed. In areas where construction could result in the need to relocate certain drainage infrastructure, temporary lines would be installed during the construction period. Care would need to be taken during construction in the vicinity of the Roseland Pump Station at 104th Street, as well as the other underground utilities called out in Section 5.3.1.1.1, in order to not damage existing structures. Proposed mitigation measures are summarized in Section 5.2.1.1 and 5.2.2.1.

5.3.2.1.2 Groundwater Impacts

See Section 5.2.2.2.

5.3.2.1.3 Water Quality Impacts

See Section 5.2.2.3.

5.3.2.1.4 Wetland Impacts

Because there are no wetlands in Segment UA of the UPRR Rail Alternative, there would be no construction impacts on wetlands.

5.3.2.2 Segment UB

5.3.2.2.1 Drainage Impacts

See Section 5.3.2.1.1.

5.3.2.2.2 Groundwater Impacts

See Section 5.2.2.2.

5.3.2.2.3 Water Quality Impacts

See Section 5.2.2.3.

5.3.2.2.4 Wetland Impacts

See Section 5.2.2.4.

5.3.3 120th Street Yard and Shop

5.3.3.1 Permanent Impacts and Mitigation

5.3.3.1.1 Drainage Impacts

The physical modifications associated with the UPRR Rail Alternative 120th Street yard and shop would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

The proposed construction would take place on pervious area; the decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation, there would be no adverse permanent stormwater drainage impacts associated with the UPRR Rail Alternative 120th Street yard and shop. Section 5.2.1.1 summarizes proposed mitigation measures.

5.3.3.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the UPRR Rail Alternative 120th Street yard and shop.

5.3.3.1.3 Water Quality Impacts

The introduction of new impervious surfaces would have the potential to increase the concentration and accumulation of runoff contaminants. After mitigation, there would be no adverse permanent water quality impacts associated with the 120th Street yard and shop. Section 5.2.1.3 summarizes proposed mitigation measures.

5.3.3.1.4 Wetland Impacts

Development of the 120th Street yard and shop facility could affect approximately 14 acres of wetlands. Following compensatory mitigation, the 120th Street yard and shop would have no adverse permanent impacts on wetlands in the API. Compensatory mitigation is discussed in Section 5.2.1.4.

5.3.3.2 Construction Impacts and Mitigation

5.3.3.2.1 Drainage Impacts

See Section 5.3.2.1.1.

5.3.3.2.2 Groundwater Impacts

See Section 5.2.2.2.

5.3.3.2.3 Water Quality Impacts

See Section 5.2.2.3.

5.3.3.2.4 Wetland Impacts

See Section 5.2.2.4.

5.4 Union Pacific Railroad Rail Alternative - East Option

5.4.1 Permanent Impacts and Mitigation - Union Pacific Railroad Rail Alternative - East Option

5.4.1.1 Segment UA

5.4.1.1.1 Drainage Impacts

Impacts associated with the UPRR Rail Alternative East Option would be similar to those discussed in Section 5.3.1.1.1. The UPRR Rail Alternative East Option alignment would be closer to the Roseland Pump Station than the ROW Option alignment; consequently, it would be more complex from a drainage standpoint. Stormwater drainage and water structures would need to be designed to accommodate the pump station as well as the other underground utilities called out in Section 5.3.1.1.1. Section 5.2.1.1 summarizes proposed mitigation measures.

5.4.1.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the UPRR Rail Alternative East Option.

5.4.1.1.3 Water Quality Impacts

See Section 5.3.1.1.3.

5.4.1.1.4 Wetland Impacts

Because there are no wetlands in Segment UA of the UPRR Rail Alternative, there would be no permanent impacts on wetlands.

5.4.1.2 Segment UB

See Section 5.3.1.2.

5.4.2 Construction Impacts and Mitigation - Union Pacific Railroad Rail Alternative - East Option

5.4.2.1 Segment UA

5.4.2.1.1 Drainage Impacts

See Section 5.3.2.1.1. Additional care would need to be taken in the vicinity of the Roseland Pump Station at 104th Street and near the other underground utilities called out in Section 5.3.1.1.1. Mitigation measures are summarized in Section 5.2.1.1 and 5.2.2.1.

5.4.2.1.2 Groundwater Impacts

See Section 5.2.2.2.

5.4.2.1.3 Water Quality Impacts

See Section 5.2.2.3.

5.4.2.1.4 Wetland Impacts

Because there are no wetlands in Segment UA along the UPRR Rail Alternative, there would be no construction impacts on wetlands.

5.4.2.2 Segment UB

See Section 5.3.2.2.

5.4.3 120th Street Yard and Shop

See Section 5.3.3.

5.5 Union Pacific Railroad Rail Alternative - West Option

5.5.1 Permanent Impacts and Mitigation - Union Pacific Railroad Rail Alternative - West Option

5.5.1.1 Segment UA

5.5.1.1.1 Drainage Impacts

The physical modifications associated with the UPRR Rail Alternative West Option would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

Much of the proposed construction would take place on already impervious land and therefore would not substantially increase the amount or peak flow rate of stormwater runoff entering the storm drain system. Pervious area is anticipated to decrease in the following areas under the West Option: along I-57, along Fernwood Parkway, around stations, and at the park & ride facilities and substations. The decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation, there would be no adverse permanent impacts on stormwater drainage associated with the UPRR Rail Alternative West Option. Section 5.2.1.1 summarizes proposed mitigation measures. Among the build alternatives, the UPRR Rail Alternative West Option would have the least impact on the Roseland Pump Station.

5.5.1.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the UPRR Rail Alternative West Option.

5.5.1.1.3 Water Quality Impacts

See Section 5.3.1.1.3.

5.5.1.1.4 Wetland Impacts

Because there are no wetlands in Segment UA of the UPRR Rail Alternative, there would be no permanent impacts on wetlands.

5.5.1.2 Segment UB

See Section 5.3.1.2.

5.5.2 Construction Impacts and Mitigation - Union Pacific Railroad Rail Alternative - West Option

5.5.2.1 Segment UA

5.5.2.1.1 Drainage Impacts

See Section 5.3.2.1.1.

5.5.2.1.2 Groundwater Impacts

See Section 5.2.2.2.

5.5.2.1.3 Water Quality Impacts

See Section 5.2.2.3.

5.5.2.1.4 Wetland Impacts

Because there are no wetlands in Segment UA of the UPRR Rail Alternative, there would be no construction impacts on wetlands.

5.5.2.2 Segment UB

See Section 5.3.2.2.

5.5.3 120th Street Yard and Shop

See Section 5.3.3.

5.6 Halsted Rail Alternative

5.6.1 Permanent Impacts and Mitigation - Halsted Rail Alternative

5.6.1.1 Segment HA

5.6.1.1.1 Drainage Impacts

The physical modifications associated with the Halsted Rail Alternative would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

Much of the proposed construction would take place on already impervious land and therefore would not substantially increase the amount or peak flow rate of stormwater runoff entering the storm drain system. Pervious area is anticipated to decrease along I-57 and around stations, park & ride facilities, and substations. The decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation there would be no adverse permanent stormwater drainage impacts associated with the Halsted Rail Alternative. Section 5.2.1.1 summarizes proposed mitigation measures.

5.6.1.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the Halsted Rail Alternative.

5.6.1.1.3 Water Quality Impacts

See Section 5.3.1.1.3.

5.6.1.1.4 Wetland Impacts

Because there are no wetlands in Segment HA of the Halsted Rail Alternative, there would be no permanent impacts on wetlands.

5.6.1.2 Segment HB

5.6.1.2.1 Drainage Impacts

The physical modifications associated with the Halsted Rail Alternative would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

Much of the proposed construction would take place on already impervious land and therefore would not substantially increase the amount or peak flow rate of stormwater runoff entering the storm drain system. Pervious area is anticipated to decrease along I-57 and around stations, park & ride facilities, and substations. The decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation, the Halsted Rail Alternative would have no adverse permanent impacts on stormwater drainage. Section 5.2.1.1 summarizes proposed mitigation measures.

5.6.1.2.2 Groundwater Impacts

The Halsted Rail Alternative would have no adverse permanent impacts on groundwater.

5.6.1.2.3 Water Quality Impacts

See Section 5.3.1.1.3.

5.6.1.2.4 Wetland Impacts

Because there are no wetlands in Segment HB of the Halsted Rail Alternative, there would be no permanent impacts on wetlands.

5.6.2 Construction Impacts and Mitigation - Halsted Rail Alternative

5.6.2.1 Segment HA

5.6.2.1.1 Drainage Impacts

See Section 5.3.2.1.1.

5.6.2.1.2 Groundwater Impacts

See Section 5.2.2.2.

5.6.2.1.3 Water Quality Impacts

See Section 5.2.2.3.

5.6.2.1.4 Wetland Impacts

Because there are no wetlands in Segment HA of the Halsted Rail Alternative, there would be no construction impacts on wetlands.

5.6.2.2 Segment HB

5.6.2.2.1 Drainage Impacts

See Section 5.3.2.1.1.

5.6.2.2.2 Groundwater Impacts

See Section 5.2.2.2.

5.6.2.2.3 Water Quality Impacts

See Section 5.2.2.3.

5.6.2.2.4 Wetland Impacts

Because there are no wetlands in Segment HB of the Halsted Rail Alternative, there would be no construction impacts on wetlands.

5.6.3 119th Street Yard and Shop

5.6.3.1 Permanent Impacts and Mitigation

5.6.3.1.1 Drainage Impacts

The physical modifications associated with the Halsted Rail Alternative 119th Street yard and shop would result in impacts on the existing stormwater drainage infrastructure. These alterations would not greatly affect the direction of drainage through the project area and would not change drainage within the watershed.

Much of the proposed construction would take place on already impervious land and therefore would not substantially increase the amount or peak flow rate of stormwater runoff entering the storm drain system. The decrease in pervious area could be mitigated by incorporating new stormwater management structures.

After mitigation, the development of the 119th Street yard and shop would have no adverse permanent impacts on stormwater drainage. Section 5.2.1.1 summarizes proposed mitigation measures.

5.6.3.1.2 Groundwater Impacts

There would be no adverse permanent groundwater impacts associated with the 119th Street yard and shop.

5.6.3.1.3 Water Quality Impacts

See Section 5.3.1.1.3.

5.6.3.1.4 Wetland Impacts

Because there are no wetlands at the 119th Street yard and shop site, there would be no permanent impacts on wetlands.

5.6.3.2 Construction Impacts and Mitigation

5.6.3.2.1 Drainage Impacts

See Section 5.3.2.1.1.

5.6.3.2.2 Groundwater Impacts

See Section 5.2.2.2.

5.6.3.2.3 Water Quality Impacts

See Section 5.2.2.3.

5.6.3.2.4 Wetland Impacts

Because there are no wetlands at the 119th Street yard and shop site, there would be no construction impacts on wetlands.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

After mitigation, there would be no effects on water resources.

6.2 Bus Rapid Transit Alternative

After mitigation, there would be no effects on water resources.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

After mitigation, there would be no effects on water resources.

6.4 Union Pacific Railroad Rail Alternative - East Option

After mitigation, there would be no effects on water resources.

6.5 Union Pacific Railroad Rail Alternative - West Option

After mitigation, there would be no effects on water resources.

6.6 Halsted Rail Alternative

After mitigation, there would be no effects on water resources.

IDNR Project #: 1304095
Date: 09/12/2012

Project: CTA Red Line Extension Project
Address: 95th Street Terminal, Chicago

Description: The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the 95th Street Station to the vicinity of 130th Street.

Natural Resource Review Results

This project was submitted for information only. It is not a consultation under Part 1075.

The Illinois Natural Heritage Database contains no record of State-listed threatened or endangered species, Illinois Natural Area Inventory sites, dedicated Illinois Nature Preserves, or registered Land and Water Reserves in the vicinity of the project location.

Location

The applicant is responsible for the accuracy of the location submitted for the project.

County: Cook

Township, Range, Section:

Disclaimer

The Illinois Natural Heritage Database cannot provide a conclusive statement on the presence, absence, or condition of natural resources in Illinois. This review reflects the information existing in the Database at the time of this inquiry, and should not be regarded as a final statement on the site being considered, nor should it be a substitute for detailed site surveys or field surveys required for environmental assessments. If additional protected resources are encountered during the project's implementation, compliance with applicable statutes and regulations is required.

Terms of Use

By using this website, you acknowledge that you have read and agree to these terms. These terms may be revised by IDNR as necessary. If you continue to use the EcoCAT application after we post changes to these terms, it will mean that you accept such changes. If at any time you do not accept the Terms of Use, you may not continue to use the website.

1. The IDNR EcoCAT website was developed so that units of local government, state agencies and the public could request information or begin natural resource consultations on-line for the Illinois Endangered Species Protection Act, Illinois Natural Areas Preservation Act, and Illinois Interagency Wetland Policy Act. EcoCAT uses databases, Geographic Information System mapping, and a set of programmed decision rules to determine if proposed actions are in the vicinity of protected natural resources. By indicating your agreement to the Terms of Use for this application, you warrant that you will not use this web site for any other purpose.
2. Unauthorized attempts to upload, download, or change information on this website are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and/or the National Information Infrastructure Protection Act.
3. IDNR reserves the right to enhance, modify, alter, or suspend the website at any time without notice, or to terminate or restrict access.

Security

EcoCAT operates on a state of Illinois computer system. We may use software to monitor traffic and to identify unauthorized attempts to upload, download, or change information, to cause harm or otherwise to damage this site. Unauthorized attempts to upload, download, or change information on this server is strictly prohibited by law.

Unauthorized use, tampering with or modification of this system, including supporting hardware or software, may subject the violator to criminal and civil penalties. In the event of unauthorized intrusion, all relevant information regarding possible violation of law may be provided to law enforcement officials.

Privacy

EcoCAT generates a public record subject to disclosure under the Freedom of Information Act. Otherwise, IDNR uses the information submitted to EcoCAT solely for internal tracking purposes.

Description: The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the 95th Street Station to the vicinity of 130th Street.

Natural Resource Review Results

This project was submitted for information only. It is not a consultation under Part 1075.

The Illinois Natural Heritage Database shows the following protected resources may be in the vicinity of the project location:

Riverdale Marsh INAI Site
Black-Crowned Night Heron *(Nycticorax nycticorax)*

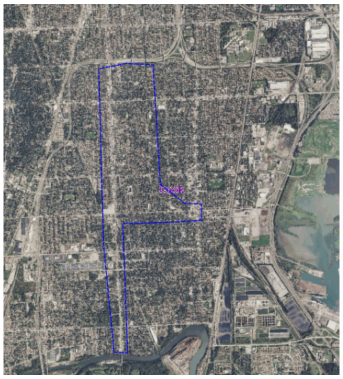
Location

The applicant is responsible for the accuracy of the location submitted for the project.



County: Cook

Township, Range, Section:

37N, 14E, 28
37N, 14E, 29
37N, 14E, 32
37N, 14E, 33

Disclaimer

The Illinois Natural Heritage Database cannot provide a conclusive statement on the presence, absence, or condition of natural resources in Illinois. This review reflects the information existing in the Database at the time of this inquiry, and should not be regarded as a final statement on the site being considered, nor should it be a substitute for detailed site surveys or field surveys required for environmental assessments. If additional protected resources are encountered during the project's implementation, compliance with applicable statutes and regulations is required.

Terms of Use

By using this website, you acknowledge that you have read and agree to these terms. These terms may be revised by IDNR as necessary. If you continue to use the EcoCAT application after we post changes to these terms, it will mean that you accept such changes. If at any time you do not accept the Terms of Use, you may not continue to use the website.

1. The IDNR EcoCAT website was developed so that units of local government, state agencies and the public could request information or begin natural resource consultations on-line for the Illinois Endangered Species Protection Act, Illinois Natural Areas Preservation Act, and Illinois Interagency Wetland Policy Act. EcoCAT uses databases, Geographic Information System mapping, and a set of programmed decision rules to determine if proposed actions are in the vicinity of protected natural resources. By indicating your agreement to the Terms of Use for this application, you warrant that you will not use this web site for any other purpose.

2. Unauthorized attempts to upload, download, or change information on this website are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and/or the National Information Infrastructure Protection Act.

3. IDNR reserves the right to enhance, modify, alter, or suspend the website at any time without notice, or to terminate or restrict access.

Security

EcoCAT operates on a state of Illinois computer system. We may use software to monitor traffic and to identify unauthorized attempts to upload, download, or change information, to cause harm or otherwise to damage this site. Unauthorized attempts to upload, download, or change information on this server is strictly prohibited by law.

Unauthorized use, tampering with or modification of this system, including supporting hardware or software, may subject the violator to criminal and civil penalties. In the event of unauthorized intrusion, all relevant information regarding possible violation of law may be provided to law enforcement officials.

Privacy

EcoCAT generates a public record subject to disclosure under the Freedom of Information Act. Otherwise, IDNR uses the information submitted to EcoCAT solely for internal tracking purposes.

MAP INFORMATION

Map Scale: 1:45,000 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:12,000.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 16N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Cook County, Illinois
Survey Area Data: Version 6, Nov 2, 2011

Date(s) aerial images were photographed: 7/30/2007; 8/3/2007

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012–2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Water Resources

In August 2015, CTA completed a wetland delineation of the areas identified as containing potential wetlands and applied the general procedures detailed in the 1987 USACE *Wetland Delineation Manual* and the 2010 *Regional Supplement-Midwest Region*.

Based on the results of the wetland delineation, CTA identified 15 wetland areas totaling 15.34 acres of potentially affected wetlands at the site of the 130th Street station and the 120th Street yard and shop. All wetland areas throughout this area are of low floristic quality and wetland function.

The wetland delineation report is included with this appendix, and contains detailed information about the fieldwork and findings.

INTRODUCTION

A wetland delineation of the 78.9-acre permanent project envelope for the southern portion of the Chicago Transit Authority's Red Line Extension, near Lake Calumet was conducted on August 13 and 19, 2015. The site is located west of Interstate 94 (Bishop Ford Expressway), north of 130th Street, along the east side of the Metropolitan Water Reclamation District of Greater Chicago's (MWRD) Calumet Waste Water Treatment plant within the City of Chicago, Cook County, Illinois (Exhibit 1). The site is further located in Sections 22, 26, and 27, Township 37 North, Range 14 East. The project permanent envelope includes Cottage Grove Avenue, parts of the MWRD property, railroad lines, and other disturbed urban-industrial landscapes. The property has been disturbed by various grading, dumping, and filling activities over the past decades.

EXISTING DATA

The United States Geological Survey (USGS) topographic map indicates open water at the locations of the MWRD sewage lagoons and sludge drying beds (Exhibit 2), but does not indicate any wetlands or blue line streams within the defined project permanent envelope. The National Wetland Inventory (NWI) map similarly depicts the sewage lagoons and sludge drying beds, but also indicates the presence of wetlands within the project permanent envelope (Exhibit 3) that are designated PF01/EMCd (palustrine, forested, broad-leaved deciduous/emergent seasonally flooded, partially drained/ditched). The Flood Insurance Rate Map indicates no mapped floodplain or floodway within the project permanent envelope (Exhibit 4). The USGS Hydrologic Atlas indicates no flood of record waters within the project permanent envelope (Exhibit 5). The Cook County Soil Survey (Exhibit 6) shows six (6) different soil series of orthents, or urban land within the project permanent envelope.

WETLAND DELINEATION

Wetlands within the project permanent envelope were delineated by Vincent Mosca and Jeffrey Mengler, PWS of Hey and Associates, Inc. using procedures outlined in the 1987 Corps of Engineers' (Corps) Wetland Delineation Manual and the 2010 Regional Supplement: Midwest Region. The entire property was inspected, with areas supporting wetland plant species prioritized for investigation. If inspection revealed that wetland plant species comprised more than 50 percent of the plant cover, the suspected wetland was further examined for field indicators of hydric soil and hydrology. The Corps-accepted field indicators of hydric soil include: gleyed and low chroma matrix and mottle colors, and iron and manganese concretions. Necessary hydric soil indicators were field verified in the wetland area if possible. In most cases in this project permanent envelope, the gravel and fill precluded investigation with hand tools, and the disturbed profiles would not have been illuminating. The Corps-approved field indicators of hydrology include: visual observation or photographic evidence of soil inundation or saturation during the growing season, oxidized channels associated with living roots and rhizomes, water marks, drift lines, waterborne sediment deposits, waterstained leaves, surface scoured areas and drainage patterns. Wetland hydrologic criteria were met in the areas delineated as wetland.

Lists of observed plant species in the wetland areas were compiled and data were gathered to complete Corps jurisdictional dataforms. A native vegetative quality rating was calculated for each wetland using the Floristic Quality Assessment (FQA) of Swink and Wilhelm as published in *Plants of the Chicago Region,* 1994. The FQA method assigns to plant species a rating that reflects the fundamental conservatism that the species exhibits for natural habitats. A native species that exhibits specific adaptations to a narrow spectrum of the environment is given a high rating. Conversely, a ubiquitous species that exhibits adaptations to a broad spectrum of environmental variables is given a low rating. Utilizing this method, a Floristic Quality Index (FQI) is derived for a given area. The FQI is an indication of native vegetative quality for an area: generally 1-19 indicates low vegetative quality, 20-35 indicates high vegetative quality and above 35 indicates "Natural Area" quality.

RESULTS

Fifteen (15) wetlands totaling 15.34 acres within the project permanent envelope were delineated on the property (Exhibit 7). The wetland boundaries shown on an aerial photograph in Exhibit 7 were recorded with sub-meter accuracy GPS unit in the field on August 13 and 19, 2015. Lists of the observed plant species for the wetland areas are given in Exhibit 8. The Corps' jurisdictional dataforms for upland and wetland areas are included as Exhibit 9. Georeferenced representative color photographs of the upland and wetland areas are provided in Exhibit 10.

Following is a table that summarizes the delineated wetlands. Wetland acreages were calculated based upon the sub-meter accuracy GPS data imported into a Geographical Information System (GIS).

Table 1. Summary of Wetlands within Project Limits.

Wetland	Area within Project Limits (acres)	Total Wetland Area (acres)	FQI[1]	Native Mean C[2]	HQAR[3]	Wetland Type	Dominant Vegetation
1 & 2	0.19	0.38	3.89	1.38	No	Drainage swale	Common reed (*Phragmites australis*)
3	0.83	0.83	6.36	4.5	No[4]	Marsh	Common reed and purple loosestrife (*Lythrum salicaria*)
4	0.07	1.85	6.43	2.43	No	Drainage swale	Common reed
5	2.73	2.73	4.95	1.75	No	Drainage swale	Common reed
6	2.26	2.26	11.13	2.43	No	Drainage swale & degraded wet prairie	Common reed
7	1.63	1.63	13.68	2.79	No	Drainage swale & degraded wet prairie	Common reed
8	1.61	1.77	6.43	2.43	No	Degraded marsh	Common reed
9	1.09	1.09	2.04	0.83	No	Drainage swale/marsh	Common reed
10	0.07	0.07	6.43	2.43	No	Drainage ditch	Common reed
11	0.05	n/a	3.00	1.50	No	Drainage ditch	Common reed
12	3.56	3.56	3.00	1.50	No	Degraded marsh	Common reed
13	0.53	0.66	2.86	1.17	No	Wooded	Box Elder (Acer negundo), Common reed (*Phragmites australis*)
14	0.20	0.88	4.00	1.33	No	Drainage swale	Common reed
15	0.52	n/a	2.00	1.00	No	Drainage swale	Common reed
TOTAL	15.34	17.71					

[1] The Floristic Quality Index (FQI) is an indication of native vegetative quality for an area: generally 1-19 indicates low vegetative quality, 20-35 indicates high vegetative quality and above 35 indicates "Natural Area" quality.

[2] The Native Mean C is an indication of native vegetative quality for an area. Areas with value of 3.5 or greater are considered high quality.

[3] The Chicago District U.S. Army Corps of Engineers has designated various Waters of the United States to be high-quality aquatic resources (HQARs). This designation is based on the definitions found within the Regional Permit Program that became effective April 1, 2007.

[4] While this area has a Native Mean C of greater than 3.5, it was based on the presence of only two native species. The remainder of the vegetation was comprised of non-native species and would not be considered high quality in any ecological assessment.

Wetlands 1 and 2 are both part of the same drainage swale along the east-west portion of South Cottage Grove Avenue, just north of 135th Street. It is dominated by common reed and defined on the south by the 135th Street embankment, on the north and west by the Cottage Grove Avenue entrance off 135th Street, and on the east by a railroad access road. It is of very low floristic quality and wetland function, and has debris and trash scattered throughout it.

Wetland 3 is on the north side of the east-west portion of South Cottage Grove Avenue, and is connected to Wetland areas 5 and 9. It is dominated by common reed. It is defined by a gravel road and fill on all sides. This was one of the few areas that had standing water during the August 2015 assessment. It is of low quality and function. It should be noted that the mean C value is 4.5, which suggests a high quality area, but this mean C value is based on the only 2 native species observed – the other 4 species were all invasive non-native species.

Wetland 4 is another drainage swale that runs from the entrance to the MWRD Calumet Wastewater Treatment Plant (WWTP) west along 135th Street. It is entirely dominated by common reed. The north boundary is defined by a mowed embankment up to the WWTP facility fence, and the southern boundary is defined by 135th Street and shoulder. The mowed area was composed of typical upland turf and weed species and not hydrophytic species, indicating that the edge of mowing corresponded with the edge of wetland. Wetland 4 appears to receive drainage from 135th Street via several stormsewers that create the undulating southern boundary.

Wetland 5 is a drainage swale that runs along the west side of South Cottage Grove Avenue from Wetland 3 north to the entrance and gatehouse for the Calumet WWTP. It is dominated by common reed, with patches of sandbar willow (*Salix interior*) and cottonwood trees (*Populus deltoides*). The eastern boundary is defined by Cottage Grove Avenue and the western boundary is a chain-link fence and mowed turf grass within the MRWDGC property.

Wetland 6 is a wet prairie drainage swale along a Indiana Harbor Belt Railroad line that does not appear to have frequent use. It is generally bounded by the railroad ballast on the west side and higher ground dominated by common buckthorn (*Rhamnus cathartica*) on the east side. Dominant vegetation was common reed, though pockets of native plant species were observed.

Similarly, Wetland 7 is a drainage swale on the west side of the same Indiana Harbor Belt Railroad line through the site. It is also bounded by the railroad ballast and higher ground covered in common buckthorn. It is of moderate floristic quality when calculated to include the scattered native wet prairie species observed, but is largely dominated by the invasive common reed.

Wetland 8 is an area of degraded marsh inside the MWRD Calumet WWTP perimeter fence, located just southeast of the gatehouse and entrance. It is surrounded by areas of fill/gravel that are much higher in elevation than the ground in the wetland area. The embankments around this wetland pocket are very steep and eroded, often at a 1:1 slope or steeper. The vegetation was dominated by common reed. It is an area of very low quality.

Wetland 9 is connected to Wetland 3 and ultimately Wetland 5. At the southern end of Wetland 5, these 3 wetland areas form a u-shaped marsh swale around a gravel fill pad that is 3-4 feet higher in elevation. This area is bounded by the MWRD Calumet WWTP entrance road and Cottage Grove Avenue. The vegetation was dominated by common reed, and it is of low quality.

Wetland 10 is a small drainage ditch that runs from the 135th Street bridge over the Indiana Harbor Belt Railroad/Metra South Shore rail lines, to Cottage Grove Avenue. It is generally lined by cottonwoods and dead green ash (*Fraxinus pennsylvanica*) with common reed dominant in the ditch. The ditch was also littered with old tires and other refuse.

Wetland 11 is a small part of a wet area between the gravel railroad access road, and the Metra South Shore rail line. Most of the wetland is outside of the project limits and is dominated by common reed.

Wetland 12 is a marsh area located just north of the MWRD Calumet WWTP gatehouse. It is bounded by gravel access roads on the east and west sides, and the entrance road on the south. On the north side the wetland gives way to higher ground dominated by common buckthorn and a variety of upland weeds. The marsh is dominated by common reed.

Wetland 13 is a small wetland drainage swale located between the Metra South Shore Electric railroad line and the Indiana Harbor Belt Railroad freight line. It is dominated by common reed and is bounded by railroad ballast.

Wetland 14 is a swale located on the east side of the Indiana Harbor Belt Railroad/Metra South Shore line, but west of the MWRD fence around some sludge drying beds and other facilities. It is partially wooded by box elder and cottonwood but in open areas remains dominated by common reed.

Wetland 15 refers to a narrow drainage swale dominated by common reed located along a MWRD gravel access road in the northwest part of the project permanent envelope. It is of very low quality.

There are no High Quality Aquatic Resources on the subject property or mapped on adjacent properties. All wetlands observed were dominated by the invasive common reed, often in dense monotypic stands. The surrounding land is primarily developed urban or industrial landscapes.

SUMMARY AND CONCLUSIONS

The wetland delineation revealed 15 wetland areas totaling 15.34 acres within the project permanent envelope as depicted on Exhibit 7. All wetlands were of low quality and dominated by the invasive common reed. Most of the wetland boundaries are defined by fill and other manmade features. A jurisdictional determination will need to be requested from the U.S. Army Corps of Engineers to determine if the wetlands are under their Clean Water Act jurisdiction or if they are isolated wetlands of Cook County.

The following floristic inventories, prepared by Hey and Associates, Inc., follow the nomenclature given in the National Wetland Plant List: (Lichvar, R. W., M. Butterwick, N.C. Melvin, and W. N. Kirchner 2014); The National Wetland Plant List 2014 Update of Wetland Ratings. (Phytoneuron 2014-41:1-42); and bio data/nomenclature follows Kartesz, J. T., 2013 *Floristic Synthesis of North America. Version 1.0 Biota of North American Program.* It also provides local synonymies based on Swink and Wilhelm's 1994 *Plants of the Chicago Region.*

Each species is listed with its database acronym and coefficient of conservatism (0 = weedy, 10 = conservative), and followed by its corresponding National Wetland Category (OBL = obligate wetland species, FACW = facultative wetland, FAC - facultative species, FACU = facultative upland, UPL = upland species), habit, duration, and nativity. Native taxa are those species believed to have been present in the Chicago region prior to European settlement.

The conservatism metric information above the species list provides analysis of the vegetative quality of the site. It shows the total number of species present (species richness), the mean coefficient of conservatism (Mean C), the floristic quality index (FQAI), and mean wetness; calculated separately for native species only and then including the adventive species (W/Adventives). The Mean C datum indicates the average coefficient of conservatism. The FQAI is derived by multiplying the Mean C by the square root of the number of species. If the FQAI of an area registers in the middle 30's or higher, one can be relatively certain that there is sufficient native character to be of rather profound environmental importance in terms of a regional natural area perspective. The wet indicator value indicates the mean or average wet indicator category for all species present, natives only and then with adventives – numbers less than 0 indicate hydrophytic vegetation, while numbers greater than 0 correspond to the upland vegetation categories. The table also provides the number of species in each physiognomic or habit class, native versus adventive along with their percentage of the total inventory.

15-0218 CDM-Smith -- CTA Red Line Extension

WETLAND DETERMINATION DATA FORM - Midwest Region

Project/Site Lake Calumet CTA Red Line Extension City/County: Cook Sampling Date: 8/13/2015
Applicant/Owner: CTA/MWRD State: Illinois Sampling Point: 1
Investigator(s): J Mengler, V Mosca Section, Township, Range: T34N R14E S26
Landform (hillslope, terrace, etc.): ditch Local relief (concave, convex, none): ditch
Slope (%): ______ Lat: 41.660019 Long: -87.595429 Datum: ______
Soil Map Unit Name: urban land-orthents clayey complex, nearly level NWI Classification: none
Are climatic/hydrologic conditions of the site typical for this time of the year? Y (If no, explain in remarks)
Are vegetation ______, soil Y, or hydrology ______ significantly disturbed? Y
Are vegetation ______, soil ______, or hydrology ______ naturally problematic? N
Are "normal circumstances" present? Y

SUMMARY OF FINDINGS

(If needed, explain any answers in remarks.)

Hydrophytic vegetation present? Y
Hydric soil present? ______
Wetland hydrology present? Y

Is the sampled area within a wetland? Y
If yes, optional wetland site ID: Wetland 1

Remarks: (Explain alternative procedures here or in a separate report.)

Relied primarily upon vegetation and landscape position due to dry time of season, and mostly urbanland/fill for substrate.

VEGETATION -- Use scientific names of plants.

Tree Stratum (Plot size: 9 m)	Absolute % Cover	Dominant Species	Indicator Status
1 *Populus deltoides*	20	Y	FAC

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 5 (A)
Total Number of Dominant Species Across all Strata: 5 (B)
Percent of Dominant Species that are OBL, FACW, or FAC: 100.00% (A/B)

Prevalence Index Worksheet

Total % Cover of:			
OBL species	0	x 1 =	0
FACW species	140	x 2 =	280
FAC species	30	x 3 =	90
FACU species	0	x 4 =	0
UPL species	0	x 5 =	0
Column totals	170 (A)		370 (B)

Prevalence Index = B/A = 2.18

Hydrophytic Vegetation Indicators:

___ Rapid test for hydrophytic vegetation
X Dominance test is >50%
X Prevalence index is ≤3.0*
___ Morphological adaptations* (provide supporting data in Remarks or on a separate sheet)
___ Problematic hydrophytic vegetation* (explain)

*Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic

Hydrophytic vegetation present? Y

Remarks: (Include photo numbers here or on a separate sheet)

SOIL

Sampling Point: 1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (Inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type*	Loc**		

*Type: C = Concentration, D = Depletion, RM = Reduced Matrix, MS = Masked Sand Grains. **Location: PL = Pore Lining, M = Matrix

Hydric Soil Indicators:

___ Histisol (A1)
___ Histic Epipedon (A2)
___ Black Histic (A3)
___ Hydrogen Sulfide (A4)
___ Stratified Layers (A5)
___ 2 cm Muck (A10)
___ Depleted Below Dark Surface (A11)
___ Thick Dark Surface (A12)
___ Sandy Mucky Mineral (S1)
___ 5 cm Mucky Peat or Peat (S3)
___ Sandy Gleyed Matrix (S4)
___ Sandy Redox (S5)
___ Stripped Matrix (S6)
___ Loamy Mucky Mineral (F1)
___ Loamy Gleyed Matrix (F2)
___ Depleted Matrix (F3)
___ Redox Dark Surface (F6)
___ Depleted Dark Surface (F7)
___ Redox Depressions (F8)

Indicators for Problematic Hydric Soils:

___ Coast Prairie Redox (A16) (**LRR K, L, R**)
___ Dark Surface (S7) (**LRR K, L)**
___ 5 cm Mucky Peat or Peat (S3) (**LRR K, L, R**)
___ Iron-Manganese Masses (F12) (**LRR K, L, R**)
___ Very Shallow Dark Surface (TF12)
___ Other (explain in remarks)

*Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic

Restrictive Layer (if observed):
Type: gravel, ballast, fill
Depth (inches): not determined

Hydric soil present? ______

Remarks:

Area mapped as urban land, and located along road at base of another road embankment. Probe refusal within 2-4 inches due to gravel and fill.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

X Surface Water (A1)
___ High Water Table (A2)
___ Saturation (A3)
___ Water Marks (B1)
X Sediment Deposits (B2)
___ Drift Deposits (B3)
___ Algal Mat or Crust (B4)
___ Iron Deposits (B5)
___ Inundation Visible on Aerial Imagery (B7)
X Sparsely Vegetated Concave Surface (B8)
___ Water-Stained Leaves (B9)
___ Aquatic Fauna (B13)
___ True Aquatic Plants (B14)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres on Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Tilled Soils (C6)
___ Thin Muck Surface (C7)
___ Gauge or Well Data (D9)
___ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

___ Surface Soil Cracks (B6)
X Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Stunted or Stressed Plants (D1)
___ Geomorphic Position (D2)
___ FAC-Neutral Test (D5)

Field Observations:

	Yes		No		Depth (inches):	
Surface water present?	Yes		No	X	Depth (inches):	
Water table present?	Yes		No	X	Depth (inches):	
Saturation present? (includes capillary fringe)	Yes	X	No		Depth (inches):	0

Wetland hydrology present? Y

Describe recorded data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Saturation within ditch channel lined by hydrophytes.

WETLAND DETERMINATION DATA FORM - Midwest Region

Project/Site: Lake Calumet CTA Red Line Extension   City/County: Cook   Sampling Date: 8/13/2015
Applicant/Owner: CTA/MWRD   State: Illinois   Sampling Point: 2
Investigator(s): J Mengler, V Mosca   Section, Township, Range: T37N, R14E, S26
Landform (hillslope, terrace, etc.): ditch   Local relief (concave, convex, none): ditch
Slope (%): ____   Lat: 41.6906323   Long: -87.6205465   Datum: ____
Soil Map Unit Name: urban land-orthents clayey complex, nearly level   NWI Classification: none
Are climatic/hydrologic conditions of the site typical for this time of the year? Y   (If no, explain in remarks)
Are vegetation ____, soil Y, or hydrology ____ significantly disturbed? Y   Are "normal circumstances" present? Y
Are vegetation ____, soil ____, or hydrology ____ naturally problematic? N

SUMMARY OF FINDINGS

(If needed, explain any answers in remarks.)

Hydrophytic vegetation present?	Y		
Hydric soil present?		**Is the sampled area within a wetland?**	Y
Wetland hydrology present?	Y	If yes, optional wetland site ID:	Wetland 2

Remarks: (Explain alternative procedures here or in a separate report.)

Relied primarily upon vegetation and landscape position due to dry time of season, and mostly urbanland/fill for substrate.

VEGETATION -- Use scientific names of plants.

___ 5 cm Mucky Peat or Peat (S3) (**LRR K, L, R**)
___ Iron-Manganese Masses (F12) (**LRR K, L, R**)
___ Very Shallow Dark Surface (TF12)
___ Other (explain in remarks)

*Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic

Restrictive Layer (if observed):
Type: gravel, ballast, fill
Depth (inches): not determined

Hydric soil present? ______

Remarks:

Area mapped as urban land, and 2-3 feet higher in elevation than adjacent wetland swales.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

___ Surface Water (A1)
___ High Water Table (A2)
___ Saturation (A3)
___ Water Marks (B1)
___ Sediment Deposits (B2)
___ Drift Deposits (B3)
___ Algal Mat or Crust (B4)
___ Iron Deposits (B5)
___ Inundation Visible on Aerial Imagery (B7)
___ Sparsely Vegetated Concave Surface (B8)
___ Water-Stained Leaves (B9)
___ Aquatic Fauna (B13)
___ True Aquatic Plants (B14)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres on Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Tilled Soils (C6)
___ Thin Muck Surface (C7)
___ Gauge or Well Data (D9)
___ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

___ Surface Soil Cracks (B6)
___ Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Stunted or Stressed Plants (D1)
___ Geomorphic Position (D2)
___ FAC-Neutral Test (D5)

Field Observations:
Surface water present? Yes ______ No X Depth (inches): ______
Water table present? Yes ______ No X Depth (inches): ______
Saturation present? (includes capillary fringe) Yes ______ No X Depth (inches): 0

Wetland hydrology present? N

Describe recorded data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

2-3 feet higher in elevation than adjacent wetland swales with no evidence of hydrology

WETLAND DETERMINATION DATA FORM - Midwest Region

Project/Site Lake Calumet CTA Red Line Extension City/County: Cook Sampling Date: 8/19/2015
Applicant/Owner: CTA/MWRD State: Illinois Sampling Point: 10
Investigator(s): J Mengler, V Mosca Section, Township, Range: T37N, R14E, S27
Landform (hillslope, terrace, etc.): swale Local relief (concave, convex, none): swale
Slope (%): ______ Lat: 41.65712 Long: -87.600738 Datum: ______
Soil Map Unit Name: orthents, loamy, nearly level NWI Classification: none
Are climatic/hydrologic conditions of the site typical for this time of the year? Y (If no, explain in remarks)
Are vegetation ______, soil Y , or hydrology ______ significantly disturbed? Y Are "normal circumstances" present? Y
Are vegetation ______, soil ______ , or hydrology ______ naturally problematic? N

SUMMARY OF FINDINGS

(If needed, explain any answers in remarks.)

Hydrophytic vegetation present?	Y	**Is the sampled area within a wetland?**	Y
Hydric soil present?		If yes, optional wetland site ID:	Wetland 8
Wetland hydrology present?	Y		

Remarks: (Explain alternative procedures here or in a separate report.)

Relied primarily upon vegetation and landscape position due to dry time of season, and mostly urbanland/fill for substrate.

VEGETATION -- Use scientific names of plants.

Saturation present? (includes capillary fringe) Yes ___ No X Depth (inches): 0

Wetland hydrology present? N

Describe recorded data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

2-4 feet higher in elevation than adjacent wetland swales with no evidence of hydrology

WETLAND DETERMINATION DATA FORM - Midwest Region

Project/Site Lake Calumet CTA Red Line Extension City/County: Cook Sampling Date: 8/13/2015
Applicant/Owner: CTA/MWRD State: Illinois Sampling Point: 14
Investigator(s): J Mengler, V Mosca Section, Township, Range: T37N, R14E, S26
Landform (hillslope, terrace, etc.): swale Local relief (concave, convex, none): swale
Slope (%): ______ Lat: 41.659598 Long: -87.594462 Datum: ______
Soil Map Unit Name: urban land- orthents, clayey, complex, nearly level NWI Classification: none
Are climatic/hydrologic conditions of the site typical for this time of the year? Y (If no, explain in remarks)
Are vegetation ______, soil Y, or hydrology ______ significantly disturbed? Y Are "normal circumstances" present? Y
Are vegetation ______, soil ______, or hydrology ______ naturally problematic? N

SUMMARY OF FINDINGS

(If needed, explain any answers in remarks.)

Hydrophytic vegetation present? Y
Hydric soil present? ______
Wetland hydrology present? Y

Is the sampled area within a wetland? Y
If yes, optional wetland site ID: Wetland 10

Remarks: (Explain alternative procedures here or in a separate report.)

Relied primarily upon vegetation and landscape position due to dry time of season, and mostly urbanland/fill for substrate.

VEGETATION -- Use scientific names of plants.

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 1 (A)
Total Number of Dominant Species Across all Strata: 1 (B)
Percent of Dominant Species that are OBL, FACW, or FAC: 100.00% (A/B)

Prevalence Index Worksheet

Total % Cover of:			
OBL species	0	x 1 =	0
FACW species	100	x 2 =	200
FAC species	0	x 3 =	0
FACU species	0	x 4 =	0
UPL species	0	x 5 =	0
Column totals	100	(A)	200 (B)

Prevalence Index = B/A = 2.00

Hydrophytic Vegetation Indicators:

___ Rapid test for hydrophytic vegetation
X Dominance test is >50%
X Prevalence index is ≤3.0*
___ Morphological adaptations* (provide supporting data in Remarks or on a separate sheet)
___ Problematic hydrophytic vegetation* (explain)

*Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic

Hydrophytic vegetation present? Y

Remarks: (Include photo numbers here or on a separate sheet)

SOIL

Sampling Point: 14

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (Inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type*	Loc**		

*Type: C = Concentration, D = Depletion, RM = Reduced Matrix, MS = Masked Sand Grains. **Location: PL = Pore Lining, M = Matrix

Hydric Soil Indicators:

___ Histisol (A1)
___ Histic Epipedon (A2)
___ Black Histic (A3)
___ Hydrogen Sulfide (A4)
___ Stratified Layers (A5)
___ 2 cm Muck (A10)
___ Depleted Below Dark Surface (A11)
___ Thick Dark Surface (A12)
___ Sandy Mucky Mineral (S1)
___ 5 cm Mucky Peat or Peat (S3)
___ Sandy Gleyed Matrix (S4)
___ Sandy Redox (S5)
___ Stripped Matrix (S6)
___ Loamy Mucky Mineral (F1)
___ Loamy Gleyed Matrix (F2)
___ Depleted Matrix (F3)
___ Redox Dark Surface (F6)
___ Depleted Dark Surface (F7)
___ Redox Depressions (F8)

Indicators for Problematic Hydric Soils:

___ Coast Prairie Redox (A16) (**LRR K, L, R**)
___ Dark Surface (S7) (**LRR K, L)**
___ 5 cm Mucky Peat or Peat (S3) (**LRR K, L, R**)
___ Iron-Manganese Masses (F12) (**LRR K, L, R**)
___ Very Shallow Dark Surface (TF12)
___ Other (explain in remarks)

*Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic

Restrictive Layer (if observed):
Type: gravel, ballast, fill
Depth (inches): not determined

Hydric soil present? ___

Remarks:

Area mapped as urban land, and located at base of roadway embankment and along railroad

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

___ Surface Water (A1)
___ High Water Table (A2)
X Saturation (A3)
___ Water Marks (B1)
___ Sediment Deposits (B2)
___ Drift Deposits (B3)
___ Algal Mat or Crust (B4)
___ Iron Deposits (B5)
___ Inundation Visible on Aerial Imagery (B7)
___ Sparsely Vegetated Concave Surface (B8)
X Water-Stained Leaves (B9)
___ Aquatic Fauna (B13)
___ True Aquatic Plants (B14)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres on Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Tilled Soils (C6)
___ Thin Muck Surface (C7)
___ Gauge or Well Data (D9)
___ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

___ Surface Soil Cracks (B6)
X Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Stunted or Stressed Plants (D1)
___ Geomorphic Position (D2)
___ FAC-Neutral Test (D5)

Field Observations:
Surface water present? Yes ___ No X Depth (inches): ___
Water table present? Yes ___ No X Depth (inches): ___
Saturation present? (includes capillary fringe) Yes X No ___ Depth (inches): 0

Wetland hydrology present? Y

Describe recorded data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Saturation within drainage swale along higher ground, wet mud among old tires.

2 *Convolvulus sepium*	15	Y	FAC
	35	= Total Cover	

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC:	3	(A)
Total Number of Dominant Species Across all Strata:	3	(B)
Percent of Dominant Species that are OBL, FACW, or FAC:	100.00%	(A/B)

Prevalence Index Worksheet

Total % Cover of:

OBL species	0	x 1 =	0
FACW species	100	x 2 =	200
FAC species	0	x 3 =	0
FACU species	0	x 4 =	0
UPL species	0	x 5 =	0
Column totals	100 (A)		200 (B)
Prevalence Index = B/A =	2.00		

Hydrophytic Vegetation Indicators:

- ___ Rapid test for hydrophytic vegetation
- X Dominance test is >50%
- X Prevalence index is ≤3.0*
- ___ Morphological adaptations* (provide supporting data in Remarks or on a separate sheet)
- ___ Problematic hydrophytic vegetation* (explain)

*Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic

Hydrophytic vegetation present? Y

Remarks: (Include photo numbers here or on a separate sheet)

SOIL

Sampling Point: 18

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (Inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type*	Loc**	Texture	Remarks

*Type: C = Concentration, D = Depletion, RM = Reduced Matrix, MS = Masked Sand Grains. **Location: PL = Pore Lining, M = Matrix

Hydric Soil Indicators:

___ Histisol (A1)
___ Histic Epipedon (A2)
___ Black Histic (A3)
___ Hydrogen Sulfide (A4)
___ Stratified Layers (A5)
___ 2 cm Muck (A10)
___ Depleted Below Dark Surface (A11)
___ Thick Dark Surface (A12)
___ Sandy Mucky Mineral (S1)
___ 5 cm Mucky Peat or Peat (S3)
___ Sandy Gleyed Matrix (S4)
___ Sandy Redox (S5)
___ Stripped Matrix (S6)
___ Loamy Mucky Mineral (F1)
___ Loamy Gleyed Matrix (F2)
___ Depleted Matrix (F3)
___ Redox Dark Surface (F6)
___ Depleted Dark Surface (F7)
___ Redox Depressions (F8)

Indicators for Problematic Hydric Soils:

___ Coast Prairie Redox (A16) (**LRR K, L, R**)
___ Dark Surface (S7) (**LRR K, L)**
___ 5 cm Mucky Peat or Peat (S3) (**LRR K, L, R**)
___ Iron-Manganese Masses (F12) (**LRR K, L, R**)
___ Very Shallow Dark Surface (TF12)
___ Other (explain in remarks)

*Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic

Restrictive Layer (if observed):
Type: gravel, ballast, fill
Depth (inches): not determined

Hydric soil present? ___

Remarks:

Area mapped as urban land, and located between gravel roads. Probe refusal within 2-4 inches due to gravel and fill.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

X Surface Water (A1)
___ High Water Table (A2)
___ Saturation (A3)
___ Water Marks (B1)
___ Sediment Deposits (B2)
___ Drift Deposits (B3)
___ Algal Mat or Crust (B4)
___ Iron Deposits (B5)
___ Inundation Visible on Aerial Imagery (B7)
___ Sparsely Vegetated Concave Surface (B8)
___ Water-Stained Leaves (B9)
___ Aquatic Fauna (B13)
___ True Aquatic Plants (B14)
___ Hydrogen Sulfide Odor (C1)
___ Oxidized Rhizospheres on Living Roots (C3)
___ Presence of Reduced Iron (C4)
___ Recent Iron Reduction in Tilled Soils (C6)
___ Thin Muck Surface (C7)
___ Gauge or Well Data (D9)
___ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

___ Surface Soil Cracks (B6)
X Drainage Patterns (B10)
___ Dry-Season Water Table (C2)
___ Crayfish Burrows (C8)
___ Saturation Visible on Aerial Imagery (C9)
___ Stunted or Stressed Plants (D1)
___ Geomorphic Position (D2)
___ FAC-Neutral Test (D5)

Field Observations:

Surface water present?	Yes	X	No		Depth (inches):	0-2
Water table present?	Yes		No	X	Depth (inches):	
Saturation present? (includes capillary fringe)	Yes	X	No		Depth (inches):	0

Wetland hydrology present? Y

Describe recorded data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM - Midwest Region

Project/Site: Lake Calumet CTA Red Line Extension
City/County: Cook
Sampling Date: 8/19/2015
Applicant/Owner: CTA/MWRD
State: Illinois
Sampling Point: 19
Investigator(s): J Mengler, V Mosca
Section, Township, Range: T37N R14E S27
Landform (hillslope, terrace, etc.): ditch
Local relief (concave, convex, none): ditch
Slope (%):
Lat: 41.667289
Long: -87.600100
Datum:
Soil Map Unit Name: urban land-orthents clayey complex, nearly level
NWI Classification: none
Are climatic/hydrologic conditions of the site typical for this time of the year? Y (If no, explain in remarks)
Are vegetation ___, soil Y, or hydrology ___ significantly disturbed? Y
Are vegetation ___, soil ___, or hydrology ___ naturally problematic? N
Are "normal circumstances" present? Y

SUMMARY OF FINDINGS

(If needed, explain any answers in remarks.)

Hydrophytic vegetation present?	N		
Hydric soil present?		**Is the sampled area within a wetland?**	N
Wetland hydrology present?	N	If yes, optional wetland site ID:	

Remarks: (Explain alternative procedures here or in a separate report.)

Relied primarily upon vegetation and landscape position due to dry time of season, and mostly urbanland/fill for substrate.

VEGETATION -- Use scientific names of plants.

	Absolute % Cover	Dominant Species	Indicator Status

Section 1
Summary

This technical memorandum analyzes the potential cumulative impacts that would occur with the implementation of the Red Line Extension (RLE) Project. The alternatives analyzed include the No Build Alternative, Bus Rapid Transit (BRT) Alternative, Union Pacific Railroad (UPRR) Rail Alternative Right-of-Way Option (ROW Option), UPRR Rail Alternative East Option (East Option), UPRR Rail Alternative West Option (West Option), and the Halsted Rail Alternative.

The No Build Alternative would not involve any construction and would not have cumulative impacts. The No Build Alternative would not result in the cumulative benefits from transit improvement, as the build alternatives would. The BRT Alternative would have beneficial cumulative impacts due to improved transit facilities, improved access and mobility, and reduction in air emissions. The UPRR Rail Alternative options all would have similar beneficial cumulative impacts due to transit improvements, improved land use and economic development, improved access and mobility, and reduction in air emissions.

The Chicago Department of Transportation (CDOT) is preparing the Far South Railroad Relocation Feasibility Study, which examines a possible project to move the existing freight operations out of the UPRR corridor, leaving the corridor vacant. The Chicago Transit Authority (CTA) would implement the ROW Option only if this separate project occurs prior to the RLE. If the relocation project does not occur, then the CTA would need to choose either the East Option or West Option in order to pursue the UPRR Rail Alternative. The ROW Option would have more beneficial cumulative impacts than the East and West Options when considered cumulatively with relocation of the UPRR, a separate project that would occur prior to implementation of the ROW Option. Due to the elimination of freight rail, there would be less noise and vibration and fewer traffic delays associated with the ROW Option than with the other UPRR Rail Alternative options.

The East and West Options would have adverse cumulative impacts for transportation and safety and security. In the East and West Options, the existing UPRR tracks would not be relocated as part of a separate, unrelated project, and highway-rail grade crossings would remain at 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Wentworth Avenue, 115th Street, and State Street. The number of trains using the existing UPRR tracks would increase substantially under the Chicago Region Environmental and Transportation Efficiency (CREATE) Program. This increase in trains may result in increased traffic, commuter delays, and increase in potential for crash frequency. Mitigation measures to address the increased potential for vehicular and pedestrian crashes can include pedestrian gates at sidewalks, intertrack fence, and fence along the parking area and ROW. To mitigate for commuter delays caused by traffic, passenger trains and UPRR freight train schedules can be synchronized to avoid or reduce trains crossing at peak hours such as morning rush hour.

The Halsted Rail Alternative would have beneficial cumulative impacts due to transit improvements, improved land use and economic development, improved access and mobility, and reduction in air emissions.

Updated July 27, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix A of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix A supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The CTA proposes to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - ROW Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP), which includes the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District (CN/ME District) tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

3.1 Regulatory Framework

3.1.1 Federal

The National Environmental Policy Act of 1969 ([NEPA] 42 United States Code 4332) requires that federal agencies consider environmental impacts before taking actions that could affect the human environment. As interpreted by the Council on Environmental Quality (CEQ), NEPA requires that "reasonably foreseeable" direct, indirect, and cumulative effects of a proposed action be considered in the decision-making process. As defined by the CEQ, the term "effects" includes "ecological, aesthetic, historic, cultural, economic, social, or health" effects.

The CEQ defines a cumulative impact as an impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor, but collectively significant, actions taking place over a period of time.

3.1.2 State

The State of Illinois Department of Natural Resources defines Cumulative Effects in its regulations governing impacts on endangered species (17 Illinois Administrative Code Part 1075):

> "Direct and indirect effects of a proposed action(s) together with the identifiable effects of actions that are interrelated or interdependent with the action. Indirect effects are those that are caused by the action but are later in time or farther in distance. Interrelated actions are those that are a part of a larger action. Interdependent actions are those that have independent utility apart from the action."

3.1.3 Local

There are no local requirements for cumulative effect analyses.

3.2 Impact Analysis Thresholds

Each resource area was analyzed independently to determine whether the impacts of the proposed alternatives would meet a threshold of significance. These analyses were presented in separate technical memoranda for each of the resource areas.

A cumulative impact would occur if an alternative had environmental impacts that were individually limited, but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project would be significant when viewed in connection with the impacts of past projects, the impacts of other current projects, and the impacts of probable future projects or expected growth.

The standards for "cumulatively considerable" were based on the established significance thresholds for each resource area or professional judgment if thresholds were not established for that resource. Determinations regarding whether a cumulative impact would be "considerable" also considered the effectiveness of mitigation measures in reducing the impact on a resource.

Compliance with previously approved plans or mitigation programs was an indicator that an impact would not be significant. Depending on the discipline area, a project's inclusion in a regional plan or projection may be a measure of whether the project would contribute to cumulative impacts.

3.3 Area of Potential Impact

The area of potential impact for each resource is presented in a separate technical memorandum specific to each resource (see Section 7, References). In general, the impact areas for cumulative impacts are broader geographic areas than those for direct impacts. The area of potential impact for cumulative impacts reflects the distribution of the individual resource and is not limited to the project area; it consists instead of the boundaries specific to the resource, such as the construction limits for a transportation improvement, private development, or other public infrastructure project that is near enough to the project and being performed at the same time, potentially inducing cumulative impacts.

3.4 Methods

The following resources were used in developing methods and determining cumulative impacts:

- Environmental Impact and Related Procedures (Code of Federal Regulations Title 23 Part 771).
- *Consideration of Cumulative Impacts in EPA Review of NEPA Document*s (U. S. Environmental Protection Agency 1999)
- *Considering Cumulative Effects Under the National Environmental Policy Act* (CEQ 1997)
- *National Cooperative Highway Research Program Report 466 - Desk Reference for Estimating the Indirect Effects of Proposed Transportation Projects* (Transportation Research Board 2002)

Information on proposed actions within the study area was reviewed to determine whether the action was appropriate to include in the cumulative analysis. The future action information was obtained from multiple public agencies. The future actions include transportation projects and rail projects (through CREATE). Many of the resources used were from online sources; however, some project information was obtained from public comments during the scoping process. The future project information was obtained from the following agencies or programs:

- CMAP
- City of Chicago
- CREATE
- Illinois Department of Transportation (IDOT)
- Metra
- Metropolitan Water Reclamation District of Greater Chicago
- Northeastern Indiana Commuter Transportation District (NICTD)
- Pace
- Regional Transit Authority
- Village of Calumet Park

Cumulative impacts analysis considers the past, present, and reasonably foreseeable future actions. The past conditions were addressed in the Affected Environment section. The cumulative analysis started with the present day conditions and included the reasonably foreseeable future conditions to the year 2030.

The following steps were used to determine the cumulative impacts for each of the resource categories:

- Define the baseline existing conditions for the resources, ecosystems, and communities. This step was documented in the technical memorandum for each resource as part of the Affected Environment section and in the description of the No Build Alternative.
- Identify the impacts of the proposed alternatives. Present the impacts as part of the analysis in the technical memorandum.
- Identify the present and reasonably foreseeable future actions and their possible impacts.
- Identify cumulative impacts for each resource.
- Identify mitigation measures for cumulative impacts, if appropriate.
- Summarize all of the cumulative impacts for the RLE Project.

The results of the final step above are included in this technical memorandum. If the RLE Project would have no direct impacts on a resource or discipline area, then there would also not be any cumulative impacts.

Section 4
Affected Environment

The project area encompasses a diverse mix of land uses including residential, commercial, and light industrial. Each RLE alternative alignment, except for that of the BRT Alternative, would begin at the existing 95th Street Terminal and would run south along I-94, then curve west to follow I-57.

The BRT Alternative would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. The corridor consists of one- to two-story residential and light commercial structures. On-street parking and generous sidewalks flank both sides of Michigan Avenue. The portion of the route south of 120th Place is partially lined with trees and consists of mostly residential. The portion of the BRT Alternative alignment south of Michigan Avenue runs through a low-density residential and light commercial district until 130th Street and Eberhart Avenue, near the Altgeld Gardens neighborhood.

South of I-57 the UPRR Rail Alternative alignment runs along an existing railroad corridor that is surrounded by a mix of residential and light commercial districts. The UPRR Rail Alternative alignment south of Michigan Avenue runs along the Metropolitan Water Reclamation District property and terminates just north of the Altgeld Gardens neighborhood.

The Halsted Rail Alternative alignment runs south along Halsted Street through a light commercial and retail corridor surrounded by residential districts. Large sidewalks and parking lanes flank both sides of Halsted Street, while the street itself contains two through lanes in either direction. The Halsted Rail Alternative alignment runs past Cedar Park Cemetery and terminates north of the bridge that carries Halsted Street over the Little Calumet River.

The following tables identify projects within the general project area that are either anticipated to be completed prior to the start of RLE construction in 2022 or that may be under construction during the RLE's proposed construction period of 2022–2026.

The project list was developed from information available from the City of Chicago, CMAP, CREATE, IDOT, Illinois State Toll Highway Authority, and CTA.

4.1 Transportation Improvement Program

Table 4-1 lists the infrastructure improvement projects that are already in the CMAP Fiscal Year 2010–2015 TIP. The projects listed in Table 4-1 are expected to be completed prior to 2022.

Table 4-1: 2010-2015 Chicago Metropolitan Agency for Planning Transportation Improvement Program Projects in the Project Area; Projects Assumed in No Build Alternative

Agency	Location	Project	Expected Completion Date
IDOT	I-94 Bishop Ford Expressway from Stony Island Avenue feeder; includes Blue Island Avenue	Repair/replace two bridges	2016
IDOT	Bridge over I-94 Bishop Ford Expressway at 111th Street	Repair bridge	2013
IDOT	I-57 from US 30 (Lincoln Highway) to I-94 (Dan Ryan Expressway/Mainline)	Repair bridge	2013
CDOT	95th Street from Western Avenue to Ewing Avenue	Coordinate traffic signal timing	2016
IDOT	Vermont Street from Western Avenue to 127th Street	Resurface road	2013
IDOT	IL 1 (Halsted Street) from 127th Street to 152nd Street	Resurface road	2013
IDOT	127th Street from Ashland Avenue to Carpenter Street	Resurface road	2014
IDOT	CREATE Western Avenue Corridor	Includes CREATE projects WA1 through WA5, WA7, WA10, WA11	2015
IDOT	CREATE East-West Corridor	Include CREATE projects EW-1, EW-2, EW-3, EW-4	2021
Metra	Regionwide	Acquire shop facility and/or equipment; work on rail tower or yard; work on vehicle maintenance facility	2016
Metra	Metra 3246 Catenary Wire, ME	Replace catenary wire at selected locations along the ME District right of way.	2014
IDOT	Bike Facility: Palos Heights - Cal-Sag Multi-Use Greenway from Centennial Trail to Burnham Greenway	Build bicycle and pedestrian facility	2014
IDOT	Hotel Florence from 11111 South Forestville, Pullman Historic District	Preserve historic facility	2012
IDOT	North Pullman Historic District Area	Conduct landscaping, preserve historic facility	2013

Notes: IDOT = Illinois Department of Transportation, CREATE = Chicago Region Environmental and Transportation Efficiency, CDOT= Chicago Department of Transportation, ME = Metra Electric

4.2 Fiscally Constrained Major Capital Projects

The *GO TO 2040 Comprehensive Regional Plan* (GO TO 2040, CMAP 2010) is a comprehensive plan for the Chicago land region. The plan outlines goals in the following areas: livable communities, human capital, efficient government, and regional mobility. *GO TO 2040* describes strategies focused on regional mobility: investing in transportation, improving public transportation, and creating a more efficient freight network. The projects listed in Table 4-2 are some of the fiscally constrained major transportation projects that may have the potential for cumulative impacts with the RLE. The expected construction dates of these projects in relation to the RLE are identified in Table 4-2.

Table 4-2: *GO TO 2040* Fiscally Constrained Major Capital Projects

Agency	Project Name	Description	Timeframe of Action in Relation to RLE Project
IDOT/Tollway	I-294/I-57 Interchange	Construction of proposed interchange at the junction of the two interstates.	Before
IDOT	I-80 Add Lanes	Construction of two lanes from River Road to I-294	Before
Metra	Metra Rock Island Improvements	Construction of a third track to the 9-mile double-track portion of the Rock Island District Line. A new flyover bridge over the NS Railroad at 63rd Street, new bi-directional signals, several new bridges over city streets, and the expansion and modernization of the 47th Street Yard.	Before
Metra	SouthWest Service Improvements	Service will be rerouted to terminate at LaSalle Station. Construction of a 2-mile segment beginning west of Belt Junction to carry trains over the parallel NS service along 74th Street over the Rock Island District tracks.	Concurrent
CDOT	West Loop Transportation Center	Construction of a proposed transportation terminal located between the Eisenhower Expressway and Lake Street. As part of this project, improvements to Union Station will be done to increase capacity.	Concurrent
CTA	Red Purple Modernization Project	Reconstruction improvements of the existing rail and stations between Belmont and Howard stations on the Red Line, and between Howard and Linden stations on the Evanston Branch.	Before/Concurrent

Notes: RLE = Red Line Extension, IDOT= Illinois Department of Transportation, Tollway = Illinois State Toll Highway Authority, CDOT = Chicago Department of Transportation, CTA = Chicago Transit Authority, NS = Norfolk Southern

4.3 State, Regional, and Local Plans

Table 4-3 lists the other actions or studies within or near the project area that are not included in either the TIP or are on the list of fiscally constrained projects. Many of the actions listed in Table 4-3 establish an outline of strategies to improve the livability and safety in the City of Chicago. Although most of these do not list specific planned projects, they may lead to future projects within the project area.

Table 4-3: Existing, Current, and Reasonably Foreseeable Future Actions

Location and Action	Description of Action	Timeframe of Action in Relation to RLE Project
Illinois Department of Natural Resources		
Illinois Coastal Management Program	Environmental Impact Statement was prepared through NOAA. Plan was adopted in 2011. Plan for preserving, restoring, and protecting the coastal resources in Illinois. In the little Calumet and Grand Calumet River corridors, Lake Calumet and Calumet River and surrounding wetland areas and degraded industrial areas will be addressed.	Concurrent
Millennium Reserve	Millennium Reserve stretches from downtown Chicago east to the Indiana border and southwest to Midewin National Tallgrass Prairie in Wilmington, Illinois. The immediate focus within this area is the Calumet Core region, encompassing numerous neighborhoods on Chicago's south side, the southeast lakefront, and 35 south suburban municipalities. Governed by Illinois State Executive Order 13-03.	Before
Illinois Department of Transportation FY 2012-2017 Highway Improvement Program

Location and Action	Description of Action	Timeframe of Action in Relation to RLE Project
Indiana Department of Transportation		
Indiana State Rail Plan	NICTD is completing a bypass of the Kensington Station in Illinois, which will give the South Shore line a second route through the Kensington Interlocking.	Before
Illiana Expressway Feasibility Study	The Illiana study area is in southern Will County and northern Kankakee County in Illinois and southern Lake County in Indiana. The study area is generally between I-65 on the east, I-55 on the west, US 30 on the north, and north Kankakee County on the south. The study proposes an east-west corridor extending from I-55 to I-65 with potential interchange to I-57. A record of decision was issued for the Illiana Corridor in January 2013.	Concurrent
Northwest Indiana Regional Development Authority		
Comprehensive Economic Strategic Plan - Phase II	As part of the West Lake Corridor expansion project, plans to expand the NICTD line from Munster to the existing South Shore line in Chicago.	Concurrent
Forest Preserve District of Cook County		
Final Capital Improvement Plan 2012-2016.	Proposed bike and equestrian trails including the Cal-Sag Trail, Beaubien Woods parking projects and site identification, and Dan Ryan woods paved trail	Before
Chicago Transit Authority		
Ashland Bus Rapid Transit	Analysis of potential service options on Western and Ashland Avenues in a study area extending approximately 21 miles in length from about Howard Street on the north, Western Avenue on the west, Ashland Avenue on the east, and 95th Street on the south	Concurrent
City of Chicago		
Chicago Climate Action Plan	This plan lists five strategies to make the City of Chicago more resilient to the effects of Climate Change, including improved transportation options. The following actions are listed under this strategy: invest in more transit, expand transit incentives, promote transit-oriented development, improve fleet efficiency, switch to cleaner fuels, make walking and biking easier, support intercity rail, and improve freight movement.	Concurrent
Chicago Railroad Economic Opportunity Plan	Study examined Chicago's industrial corridors for the sustainability of the railroad industry. The Calumet Industrial Corridor was identified as one of the five areas most suitable for rail-based industries to be studied in depth. Within this corridor the following projects are included: the NS grade crossings at Torrence Avenue and 130th Street out of the Ford Assembly Plant and the connection from CREATE's east-west corridor from Pullman Junction to the NS mainline.	Concurrent

Location and Action	Description of Action	Timeframe of Action in Relation to RLE Project
Chicago Streets for Cycling Plan	Chicago Streets for Cycling Plan 2020 is a complementary plan to Bike 2015 Plan. The three principles in the plan are to provide a bicycle accommodation within ½ mile of every Chicagoan, provide a greater number of bikeways where more people live, and increase the amount of infrastructure where ridership is high, while establishing a strong backbone of infrastructure where ridership is currently lower. The plan calls for 100 miles of protected bike lanes, 10 miles of neighborhood greenways, 20 miles of bike lanes on Neighborhood Bike Routes, and continuous bikeways on three Spoke Routes by 2015. The plan calls for the following by 2020: continuous bikeways on all Spoke Routes, an additional 50 miles of protected bike lanes, an additional 30 miles of neighborhood greenways, an additional 40 miles of bike lanes on Neighborhood Bike Routes, and marking and/or signage on all Neighborhood Bike Routes.	Concurrent
Chicago Pedestrian Plan	The Chicago Pedestrian Plan has the following goals: 1) Improve pedestrian safety by eventually eliminating pedestrian fatalities, designing and building safer streets for pedestrians, and improving safety by reducing crime. 2) Improve connectivity by identifying and eliminating gaps and barriers in the pedestrian network, improving pedestrian connectivity to transit, and improving at-grade railroad crossings. 3) Increase livability by increasing the amount and quality of pedestrian space and increasing activity in pedestrian space. 4) Improve health by increasing the number of pedestrian trips for enjoyment, school, work, and daily errands and increasing the mode share of pedestrian trips.	Concurrent
Far South Railroad Relocation Study	Study to potentially relocate the UPRR to another railroad ROW.	Before
South Lakefront Corridor Transit Study	CDOT and Department of Housing and Economic Development have commissioned this study to identify ways to improve public transportation in the corridor, enhance mobility for residents, and increase access to jobs located throughout the city and surrounding areas. The study area includes northern stops on the Red Line and the Metra Electric District line.	Concurrent

Location and Action	Description of Action	Timeframe of Action in Relation to RLE Project
Transit Friendly Development Guide/Station Area Typology Study	The Transit Friendly Development Guide designates each rail station with one of seven typologies that are common across the rail system. The designations are intended to shape the public's expectations about potential development while identifying the nearby zoning and infrastructure assets that maximize each station as a community anchor.	Concurrent
Calumet Area Land use Plan	Study lists potential uses for land. Document intended to direct future development in the Calumet area.	Concurrent
Ford Calumet Environmental Center	A proposed center for research and learning located within the Hegewisch Marsh area, a 130-acre wetland undergoing restoration.	Concurrent
Chicago Union Station Master Plan	The study identified potential ideals for adding tracks and platforms, as well as increasing the capacity of the station. Long-term concepts include developing a new station facility at 300 South Riverside or proposing a new commuter and intercity passenger train station on the 200 South Riverside block.	Concurrent
North Pullman TIF District	The North Pullman TIF District was created to promote ongoing investment in the district’s existing buildings and vacant properties, especially the retail and commercial buildings on 103rd Street and the 11.5-acre Union Foundry site near 104th Street and Maryland Avenue. Expires in 2033.	Concurrent/After
West Pullman Industrial TIF District	Created to support ongoing industrial investments within the West Pullman Industrial Park. Intended to foster the area’s revitalization through site assembly efforts, soil remediation projects, and numerous infrastructure improvements. Infrastructure projects included were the reconstruction of 119th Street, 120th Street, and Morgan Street, and portions of Loomis Street and Racine Avenue. Expires in 2021.	Concurrent
Calumet River TIF District	Redevelopment plan for area includes plan for remediation	Concurrent
Mercy Housing	Pullman Wheelworks: A nationally registered Historical building at 901 E. 104th Street. The project includes a renovation of the 210-unit rental complex.	Before
Urban Land Institute - Pullman Study	Study recommends redeveloping the area in phases as a mixed-use development. The study recommends reuse of existing buildings.	Before
Chicago Neighborhood Initiatives - Pullman Park	Pullman Park will be a 180-acre, sustainable, mixed-use development that provides retail services, diverse recreational opportunities, and quality housing to the greater Pullman and Roseland Communities on the south side of Chicago. The first phase of development will include the reconstruction of Doty Avenue and a new 150,000-square-foot Walmart store.	Concurrent

Location and Action	Description of Action	Timeframe of Action in Relation to RLE Project
Chicago Park District		
2012-2016 Capital Improvement Plan	Development of Calumet area properties is part of the 2012-2016 Plan. Properties include Hegewisch Marsh Expansion, Big Marsh Expansion, Kensington Park, Park development - 114th Street and Champlain Avenue, West Pullman Transition plan access improvements, and Palmer Field House.	Concurrent
Friends of the Cal-Sag Trail	Proposed trail along the Little Calumet River and Cal-Sag Channel.	Before
Chicago State University		
Master Plan	Master plan includes campus improvements, proposed buildings, and a transit facility for a proposed Metra station and CTA bus turnaround.	Concurrent
CREATE		
Traffic Control System Blue Island (B15) - Signalization of Blue Island Yard Running Tracks	The project includes installation of new bi-directional computerized traffic control system between the intersections of 140th Street and Western Avenue in Blue Island and the intersection of 140th Street and Indiana Avenue in Dolton, Illinois, to improve speed of freight trains, reducing freight conflicts with Amtrak.	Before
75th Street Corridor Improvement Project	Includes CREATE projects EW2, GS19, P2, and P3[1]	Before
EW2 & P2	The project will consider reconfiguring and building a third BRC main track and constructing a flyover to connect the Metra Southwest Service to the Rock Island Line in the vicinity of 74th Street and Normal Avenue and 75th Street and Parnell Avenue.	Before
P3	This project will consider constructing a bridge that significantly reduces conflicts between CSX and BRC, Metra (Rock Island District) and NS.	Before
GS19	The project will consider a road-rail grade separation of 71st Street and CSX freight.	Before
95th Street & Union Pacific Grade Separation (GS21a)	95th Street and Eggleston Avenue. The project will consider eliminating the at-grade crossing of 95th Street and two UPRR tracks with an overpass or underpass for vehicles using 95th Street.	Concurrent
Cottage Grove & IHB/CSX Grade Separation (GS23a)	The project will consider eliminating at-grade crossing of Cottage Grove Avenue and the four IHB and CSX tracks with an overpass or underpass for vehicles.	Concurrent

---

[1] Table 4-1 lists the CREATE projects that have been included in the 2010-2015 Transportation Improvement Program.

Location and Action	Description of Action	Timeframe of Action in Relation to RLE Project
Canadian National Railway		
Logistics Park	Proposed Logistics Park that will connect directly to CN's Chicago Intermodal Terminal. Located south of I-80/294 between Ashland Avenue and Dixie Highway.	Concurrent
Metra		
Southeast Corridor Alternatives Analysis	33.2 miles of proposed line from LaSalle Street Station to terminal near Balmoral Park. Would run along the following four existing railroad ROWs: Joint Union Pacific/CSX Transportation freight corridor from Balmoral Park to Dolton junction, UPRR from Dolton Junction to Oakdale Junction, Chicago Rail Link From Oakdale Junction to Gresham Interlocking, Metra Rock Island District from Gresham interlocking to LaSalle Street Station. Ten new stations and three existing stations (existing Rock Island District stations).	Concurrent/After
Metropolitan Water Reclamation District		
Calumet Waste Water Treatment Plant	Proposed improvements to the Calumet Waste Water Treatment Plant disinfection system.	Before
Village of Riverdale		
Northeast Riverdale Sewer System	New storm sewers and existing sewer improvements.	Before
Calumet-Sangamon Bike Trail Project:	33 miles of constructed bike trail through Riverdale.	Before
Private		
Crown Commercial Real Estate & Development – Roseland Plaza	Roseland Plaza redevelopment would be adjacent to the Michigan Avenue station. The proposal includes a strip mall within a 91,000-square-foot property with 250 parking spaces. There would be 49,000 square feet of commercial space, which would include a grocery store, pharmacy, clothing store, and a bank. The City's Community Development Commission designated the developer in February 2005. The City approved the sale of its land and land write-down costs in May 2009. The developer modified its proposal and received approval of its Planned Development application from the Chicago Plan Commission in October 2011.	Before/Concurrent

Notes: NOAA = National Oceanic and Atmospheric Administration, IDOT = Illinois Department of Transportation, NICTD = Northern Indiana Commuter Transportation District, NS = Norfolk Southern, CREATE = Chicago Region Environmental and Transportation Efficiency, ROW = right-of-way, UPRR = Union Pacific Railroad, CDOT = Chicago Department of Transportation, CTA = Chicago Transit Authority, TIF = tax-increment financing, BRC = Belt Railway of Chicago, IHB = Indiana Harbor Belt Railroad, CN = Canadian National

Section 5
Impacts and Mitigations

5.1 No Build Alternative

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the CMAP Fiscal Year 2010–2015 TIP. Table 4-1 lists the TIP projects within the project area, consisting of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities.

The No Build Alternative would not contribute to cumulative benefits or impacts for the following resources: transportation; land use and economic development; displacements and relocations; parklands and community facilities; visual and aesthetic conditions; noise and vibration; safety and security; historic and cultural resources; hazardous materials; water resources; wetlands; floodplains; vegetation and wildlife habitat; threatened or endangered species; geology and soils; energy; and environmental justice. These resources could be independently affected by the project and were analyzed separately. Only resources that would incur cumulative impacts due to multiple projects are presented in this section. The following sections discuss environmental resources with the potential to be subject to cumulative benefits or impacts with the No Build Alternative.

5.1.1 Neighborhood and Community Impacts

Although the No Build Alternative would not have adverse cumulative impacts, the lack of improved transportation options and lack of new infrastructure would do little to reverse the disinvestment in the project area that has occurred over the past several decades.

5.1.2 Air Quality

The Red and Purple Modernization (RPM) Project is a reasonably foreseeable action that would result in beneficial air quality impacts, as it is anticipated to have an increase in ridership with a corresponding reduction in trips made by vehicles. The cumulative impacts would result in a reduction of air emissions and would be beneficial. The air quality benefits of the No Build Alternative would be smaller in scale than those of any of the other RLE alternatives.

5.2 Bus Rapid Transit Alternative

The BRT Alternative is a 5.5-mile long BRT route that would provide an enhanced bus route with transit signal priority along the existing #34 South Michigan bus route. Four stops with improved bus shelters and parking would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue.

The BRT Alternative would not contribute to cumulative benefits or impacts for the following resources: transportation; land use and economic development; displacements and relocations; visual and aesthetic conditions; noise and vibration; safety and security; historic and cultural resources; hazardous materials; water resources; wetlands; floodplains; vegetation and wildlife habitat; threatened or endangered species; geology and soils; energy; and environmental justice. These resources could be independently affected by the project and were analyzed separately. Only resources that would incur cumulative impacts due to multiple projects are presented in this section. The following sections discuss environmental resources with the potential to be subject to cumulative benefits or impacts with the BRT Alternative.

5.2.1 Neighborhood and Community Impacts

The minimal improvements of transportation options and new infrastructure would do little to reverse the disinvestment in the project area that has occurred over the past several decades. The cumulative impacts on neighborhood and communities would not be adverse and would not require mitigation measures.

5.2.2 Parklands and Community Facilities

The construction and operation of the BRT Alternative would not reduce the overall health of the parklands and/or community facilities in the project area. Improved transit in the project area would result in improved access to parklands and community facilities beyond the project area and within walking distance of CTA's greater rail network.

5.2.3 Air Quality

The RPM Project is a reasonably foreseeable action that would result in beneficial air quality impacts, as it is anticipated to have an increase in ridership with a corresponding reduction in trips made by vehicles. The cumulative impacts would be beneficial due to the reduction of air emissions.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative would extend the Red Line from the existing 95th Street Terminal to 130th Street, just west of I-94. Under the UPRR Rail Alternative ROW Option (ROW Option) the CTA tracks would be placed in the UPRR ROW between I-57 and the CN/ME tracks. As part of a separate project, the existing freight operations would be moved out of the UPRR corridor, leaving the corridor vacant. The CTA could implement the ROW Option only if this separate project occurs prior to RLE. Four stations would be included in the ROW Option: 103rd Street, 111th Street, Michigan Avenue, and 130th Street. One terminal station at 130th Street is under evaluation with two options: the South Station Option and the West Station Option. Substations are tentatively proposed for the following locations: west of the CTA tracks between 104th and 105th Streets, west of the CTA tracks between Perry and Lafayette Avenues, and west of the CTA tracks north of the proposed parking structure for the South Station Option or along the curve of the CTA tracks near 130th Street for the West Station Option. An additional substation within the 120th Street yard and shop facility is proposed.

The ROW Option would not contribute to cumulative benefits or impacts for the following resources: displacements and relocations; visual and aesthetic conditions; historic and cultural resources; hazardous materials; water resources; wetlands; floodplains; vegetation and wildlife habitat; threatened or endangered species; geology and soils; energy; and environmental justice. These resources could be independently affected by the project and were analyzed separately. Only resources that would incur cumulative impacts due to multiple projects are presented in this section. The following sections discuss environmental resources with the potential to be subject to cumulative benefits or impacts with the ROW Option.

5.3.1 Transportation

There could be beneficial impacts on traffic due to the relocation of the UPRR. There would be fewer traffic delays with the ROW Option than with the East or West Options.

5.3.2 Noise and Vibration

There could be beneficial impacts on noise and vibration from the ROW Option when considering the relocation of the UPRR. Because UPRR freight operations would be relocated, the ROW Option would result in less noise and vibration than under the No Build Alternative, and would result in less noise and vibration than the East and West Options would.

5.3.3 Safety and Security

The ROW Option could have beneficial impacts on safety due to the relocation of the UPRR. The relocation of the UPRR would eliminate conflicts between freight trains and motor vehicles or pedestrians accessing the transit facilities.

5.3.4 Land Use and Economic Development

Land use and economic development impacts for the UPRR Rail Alternative were analyzed for two segments in the project area, Segment UA and UB, as shown on Figure 2-1.

5.3.4.1 Segment UA

Implementation of the ROW Option would have a beneficial cumulative impact on land use and economic development due to new employment accessibility, attraction of new development adjacent to RLE stations, and overall livability improvements. The private sector would likely perceive the ROW Option as a public sector commitment to improve the overall project area and regain confidence in the area’s economic development market. The affected neighborhoods include Washington Heights, Roseland, and West Pullman. The UPRR ROW Option would only be implemented if the UPRR were relocated as part of a separate, independent project prior to the construction of the UPRR ROW Option. This action would benefit adjacent residential neighborhoods that would be relieved of the noise, vibration, and traffic delays caused by the UPRR operations.

5.3.4.2 Segment UB

The cumulative land use and economic development impacts would be similar to those described for Segment UA (Section 5.3.1.1). The cumulative land use and economic development impacts would be considered beneficial in West Pullman and Riverdale.

5.3.5 Neighborhood and Community Impacts

The retail and commercial space on the ground floor of the Michigan Avenue station's park & ride garage, combined with the proposed Roseland Plaza north of the station site, would help activate the neighborhood and enhance the station's role as a focal point of community activity and services. The station and retail improvements may contribute to a southward expansion of the current commercial and entertainment district along Michigan Avenue between 111th and 113th Streets. The relocation of the UPRR would benefit adjacent residential neighborhoods that would be relieved of the noise, vibration, and traffic delays caused by the UPRR operations.

5.3.6 Parklands and Community Facilities

The construction and operation of the ROW Option would not reduce the overall health of the parklands and/or community facilities in the project area. Improved transit in the project area would result in improved access to parklands and community facilities beyond the project area and within walking distance of CTA's greater rail network.

5.3.7 Air Quality

The RPM Project is a reasonably foreseeable action that would result in beneficial air quality impacts, as it is anticipated to have an increase in ridership with a corresponding reduction in trips made by vehicles. The cumulative impacts would be beneficial due to the reduction of air emissions.

5.4 Union Pacific Railroad Rail Alternative - East Option

In the UPRR Rail Alternative East Option (East Option), the CTA tracks would be placed immediately adjacent to and east of the UPRR ROW between I-57 and the CN/ME tracks. The UPRR is evaluating adding a third track to the east of its two existing tracks. The East Option would include substations at the following locations: west of the UPRR tracks between 104th and 105th Streets, west of the UPRR tracks between Perry Avenue and Lafayette Avenue, and west of the CTA tracks south of the proposed yard near the 130th Street station. An additional substation within the 120th Street yard and shop facility is proposed. Four stations would be included in the East Option: 103rd Street, 111th Street, Michigan Avenue, and 130th Street. One terminal station at 130th Street is under evaluation with two options: the South Station Option and the West Station Option.

The East Option would have no or limited impacts on the following resources: displacements and relocations; visual and aesthetic conditions; noise and vibration; historic and cultural resources; hazardous materials; water resources; wetlands; floodplains; vegetation and wildlife habitat; threatened or endangered species; geology and soils; energy; and environmental justice. This alternative would therefore not contribute to cumulative impacts for the environmental resources listed above. The environmental resources that have the potential to be subject to cumulative impacts are discussed in the following sections for the East Option.

5.4.1 Transportation

The CREATE 75th Street Corridor Improvement Project would increase freight volumes substantially by the forecasted 2029 build year. Because the UPRR tracks would remain with the East Option, freight trains may have potential impacts on pedestrian and vehicular traffic near the proposed stations, which could affect travel times for bus transit serving the stations and increase delays for commuters who choose to park and ride. Potential mitigation measures could include the coordination of passenger and UPRR freight train schedules to avoid or reduce trains crossing at peak hours such as morning rush hour. CTA train and bus schedules could also be coordinated with passenger and UPRR trains to reduce commuter delays.

5.4.2 Land Use and Economic Development

Cumulative land use and economic development impacts for the East Option would be similar to those stated in Section 5.3.4 for the ROW Option for Segments UA and UB, with the exception of the additional benefits of the ROW Option considered cumulatively with the UPRR relocation project, a separate project that would occur before implementation of the UPRR ROW Option.

5.4.3 Neighborhood and Community Impacts

Cumulative neighborhood and community impacts for the East Option would be similar to those stated in Section 5.3.5 for the ROW Option, with the exception of the additional benefits that the ROW Option would have due to the prior relocation of the UPRR.

5.4.4 Parklands and Community Facilities

Cumulative parklands and community facilities impacts for the East Option would be similar to those stated in Section 5.3.6 for the ROW Option.

5.4.5 Safety and Security

In addition to the expected increase in automobile and pedestrian traffic volumes as a result of the RLE Project when compared to the No Build Alternative, the full implementation of the CREATE program would increase the number of trains using the UPRR tracks from 26 to 48 per day. The proposed Metra SouthEast Service Line, if implemented, could also increase the number of passenger trains per day on the line beyond the existing two Amtrak trains per day. The increase in train volumes could correlate to an increase in potential crash frequency at highway-rail grade crossings. This increase in crash potential would be an adverse impact at the existing highway-rail grade crossings along the UPRR tracks at 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Wentworth Avenue, 115th Street, and State Street. All of these crossings currently have gates on both roadway approaches and flashing lights. Crash potential could be further mitigated by installing safety protection technologies for vehicles and pedestrians to prevent drivers from going around the gates, and by installing pedestrian gates on the sidewalks.

5.4.6 Air Quality

Cumulative air quality impacts for the East Option would be similar to those stated in Section 5.3.7 for the ROW Option.

5.5 Union Pacific Railroad Rail Alternative - West Option

In the UPRR Rail Alternative West Option (West Option), the CTA tracks would be placed immediately adjacent to and west of the UPRR ROW between I-57 on the north end and the UPRR tracks near Kensington Park on the south end. The West Option would include substations at the following locations: east of the UPRR tracks between 105th Street and 105th Place, west of the UPRR tracks between Perry Avenue and Lafayette Avenue, and east of the CTA tracks south of the proposed yard near the 130th Street station. An additional substation within the 120th Street yard and shop facility is proposed. Four stations would be included in the West Option: 103rd Street, 111th Street, Michigan Avenue, and 130th Street. One terminal station with two options is under evaluation for the 130th Street station: the South Station Option and the West Station Option.

The West Option would have limited or no impacts on the following resources: displacements and relocations; visual and aesthetic conditions; noise and vibration; historic and cultural resources; hazardous materials; water resources; wetlands; floodplains; vegetation and wildlife habitat; threatened or endangered species; geology and soils; energy; and environmental justice. This alternative would therefore not contribute to substantial cumulative impacts for the environmental resources listed above. The environmental resources that have the potential to be subject to cumulative impacts are discussed in the following sections for the West Option.

5.5.1 Transportation

Cumulative transportation impacts for the West Option would be similar to those stated in Section 5.4.1 for the East Option.

5.5.2 Land Use and Economic Development

Cumulative land use and economic development impacts for the West Option would be similar to those stated in Section 5.3.4 for the ROW Option for Segments UA and UB with the exception of the additional benefits of the ROW Option considered cumulatively with the UPRR relocation project.

5.5.3 Neighborhood and Community Impacts

Cumulative neighborhood and community impacts for the West Option would be similar to those stated in Section 5.3.5 for the ROW Option with the exception of the additional benefits of the ROW Option considered cumulatively with the UPRR relocation project.

5.5.4 Parklands and Community Facilities

Cumulative parklands and community facilities impacts for the West Option would be similar to those stated in Section 5.3.6 for the ROW Option.

5.5.5 Safety and Security

Cumulative safety and security impacts for the West Option would be similar to those stated in Section 5.4.5 for the East Option.

5.5.6 Air Quality

Cumulative air quality impacts for the West Option would be similar to those stated in Section 5.3.7 for the ROW Option.

5.6 120th Street Yard and Shop

There would be no cumulative impacts associated with the 120th Street yard and shop.

5.7 Halsted Rail Alternative

The proposed Halsted Rail Alternative is a 5-mile extension of the existing Red Line. It would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. It would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. Four stations would be built at 103rd Street, 111th Street, 119th Street, and Vermont Avenue.

The Halsted Rail Alternative would have limited or no impacts on the following resources: transportation; displacements and relocations; neighborhoods and community facilities; visual and aesthetic conditions; noise and vibration; safety and security; historic and cultural resources; hazardous materials; water resources; wetlands; floodplains; vegetation and wildlife habitat; threatened or endangered species; geology and soils; energy; and environmental justice. This alternative would therefore not contribute to substantial cumulative impacts for the environmental resources listed above. The environmental resources that have the potential to be subject to cumulative impacts are discussed in the following sections for the Halsted Rail Alternative.

5.7.1 Land Use and Economic Development

Land use and economic development impacts for the Halsted Rail Alternative were analyzed for two segments in the project area, Segment HA and HB, as shown on Figure 2-1.

5.7.1.1 Segment HA

Cumulative land use and economic development impacts for the Halsted Rail Alternative would be similar to those stated in Section 5.3.4 for the UPRR ROW Option including the community of Morgan Park. The cumulative land use and economic development impacts would be beneficial for Washington Heights, Roseland, West Pullman, and Morgan Park.

5.7.1.2 Segment HB

The cumulative land use and economic development impacts would be similar to those stated in Section 5.3.4 for the UPRR ROW Option with the exception that only West Pullman would receive beneficial cumulative impacts from the Halsted Rail Alternative.

5.7.2 Parklands and Community Facilities

The construction and operation of the Halsted Rail Alternative would not reduce the overall health of the parklands and/or community facilities in the project area. Improved transit in the project area would result in improved access to parklands and community facilities beyond the project area and within walking distance of CTA's greater rail network.

5.7.3 Air Quality

The RPM Project is a reasonably foreseeable action that would result in beneficial air quality impacts, as it is anticipated to have an increase in ridership with a corresponding reduction in trips made by vehicles. The cumulative impacts would be beneficial due to the reduction of air emissions.

5.8 119th Street Yard and Shop

There would be no cumulative impacts associated with the 119th Street yard and shop.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

Because there would be no adverse cumulative impacts, no mitigation measures would be required for the No Build Alternative.

6.2 Bus Rapid Transit Alternative

Because there would be no adverse cumulative impacts, no mitigation measures would be needed for the BRT Alternative. There would be beneficial cumulative impacts on air quality due to the reduction in air emissions.

6.3 Union Pacific Railroad Rail Alternative – Right-of-Way Option

Because there would be no adverse cumulative impacts, no mitigation measures would be needed for the ROW Option. The ROW Option would have beneficial impacts for land use and economic development, neighborhoods and communities, parklands, and air quality.

6.4 Union Pacific Railroad Rail Alternative – East Option

6.4.1 Transportation

There would be no adverse impacts remaining after the mitigation measures discussed in Section 5.4.1 are implemented.

6.4.2 Land Use and Economic Development

There would be beneficial cumulative impacts on land use and economic development; therefore, no mitigation measures would be needed.

6.4.3 Neighborhood and Community Impacts

There would be beneficial cumulative impacts on neighborhoods and communities; therefore, no mitigation measures would be needed.

6.4.4 Parklands and Community Facilities

There would be beneficial cumulative impacts on parklands and community facilities; therefore, no mitigation measures would be needed.

6.4.5 Safety and Security

There would be no adverse impacts remaining after mitigation measures discussed in Section 5.4.5 are implemented.

6.4.6 Air Quality

There would be beneficial impacts on air quality with or without the RPM Project, a reasonably foreseeable action. No mitigation measures would be required.

6.5 Union Pacific Railroad Rail Alternative – West Option

6.5.1 Transportation

There would be no adverse impacts remaining after the mitigation measures discussed in Section 5.4.1 are implemented.

6.5.2 Land Use and Economic Development

There would be beneficial cumulative impacts on land use and economic development; therefore, no mitigation measures would be needed.

6.5.3 Neighborhood and Community Impacts

There would be beneficial cumulative impacts on neighborhoods and communities; therefore, no mitigation measures would be needed.

6.5.4 Parklands and Community Facilities

There would be beneficial cumulative impacts on parklands and community facilities; therefore, no mitigation measures would be needed.

6.5.5 Safety and Security

There would be no adverse impacts remaining after the mitigation measures discussed in Section 5.4.5 are implemented.

6.5.6 Air Quality

There would be beneficial impacts on air quality with or without the RPM Project, a reasonably foreseeable action. No mitigation measures would be needed.

6.6 120th Street Yard and Shop

There would be no cumulative impacts for the 120th Street yard and shop; therefore, no mitigation measures would be needed.

6.7 Halsted Rail Alternative

6.7.1 Land Use and Economic Development

There would be beneficial cumulative impacts on land use and economic development; therefore no mitigation measures would be needed.

6.7.2 Parklands and Community Facilities

There would be beneficial cumulative impacts on parklands and community facilities; therefore, no mitigation measures would be needed.

6.7.3 Air Quality

There would be beneficial impacts on air quality with or without the RPM Project, a reasonably foreseeable action. No mitigation measures would be needed.

6.8 119th Street Yard and Shop

There would be no cumulative impacts associated with the 119th Street yard and shop; therefore, no mitigation measures would be needed.

Appendix A
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on carbon monoxide (CO) hot spots, project-related greenhouse gas (GHG) emissions, fine particulate matter (particulate matter with an aerodynamic diameter of 2.5 micrometers and less [$PM_{2.5}$]) hot spots, mobile source air toxics (MSAT), impacts of construction, possible mitigation measures, and cumulative impacts.

The project area is in Cook County, Illinois, which has been designated as a nonattainment area with respect to the ozone national ambient air quality standard (NAAQS). The U.S. Environmental Protection Agency (USEPA) has also designated it as a nonattainment area with respect to the $PM_{2.5}$ NAAQS. The Illinois Environmental Protection Agency (IEPA) is seeking a redesignation from USEPA to attainment for $PM_{2.5}$. Because the RLE Project is in a “Moderate” ozone nonattainment area, it is the Federal Transit Administration’s (FTA’s) responsibility, as the federal funding agency, to ensure that the proposed project conforms to the Illinois State Implementation Plan (SIP).

Conformity can be demonstrated by showing that the proposed project is included in a conforming Regional Transportation Plan (RTP). The RLE Project is included in the Chicago Metropolitan Agency for Planning’s (CMAP’s) *GO TO 2040,* which is a conforming RTP published in 2010. Therefore, this project conforms to the objectives of the SIP, and further demonstration of the project compliance with the transportation conformity rule is not required. However, for the purpose of National Environmental Policy Act (NEPA) disclosure, an evaluation of project impacts was conducted.

Based on the results of the air quality analysis presented here, all build alternatives of the RLE Project would provide a regional net air quality benefit.

Based on the results of the CO modeling analysis at selected traffic intersections in the project area, implementation of any of the RLE Project build alternatives would not lead to exceedances of the Illinois Ambient Air Quality Standards (IAAQS) and NAAQS and no adverse air quality impacts are expected to occur with any of the build alternatives. Based on the CO hot spot analysis, no air quality mitigation measures would be required for any of the traffic intersections analyzed for any of the build alternatives.

The FMVECP (Federal Motor Vehicle Emission Control Program) (40 United States Code [USC] § 7521), which has been very effective in controlling emissions of all of the criteria pollutants, has little or no impact on GHG emissions from motor vehicles. The same technology that leads to more efficient fuel use also leads to lower carbon dioxide (CO_2) emissions. Because estimated changes in vehicle-miles traveled (VMT) would be quite small, the changes in GHG emissions in the project area would also be quite small. Compared to the No Build Alternative, the total carbon dioxide equivalent (CO_2e) emissions from any of the alternatives would be about 0.02 percent lower. Indirect emissions from the fossil-fueled power plants would increase because of increased electrical energy demand for the project.

The $PM_{2.5}$ emissions factors for motor vehicles in the Chicago area are expected to decline by over 38 percent between 2012 and 2030. In addition, VMT in the project area under all of the build alternatives (including VMT generated by additional bus operations) would be slightly lower than under the No Build Alternative VMT, by about 0.02 percent, due to passenger diversions to the RLE Project. When taken together, the regional $PM_{2.5}$ emissions with implementation of the build alternatives would be slightly lower than with the No Build Alternative. In addition to the federal exhaust emissions control programs and fuel reformulation programs, statewide efforts to reduce congestion and vehicle idling are also expected to have a direct benefit by reducing $PM_{2.5}$ concentrations at the local level.

The USEPA's FMVECP is expected to reduce MSAT emissions by 54 percent in the project area between 2012 and 2030. In addition, VMT in the project area for all build alternatives are expected to be slightly lower than under the No Build Alternative, by about 0.02 percent, due to passenger diversions to the Red Line. When taken together, regional MSAT emissions under any of the build alternatives in 2030 would be slightly lower than with the No Build Alternative.

The potential air quality impacts during construction would primarily be associated with dust and vehicle exhaust emissions. The IEPA has strict guidelines for controlling fugitive dust, diesel soot emissions, and GHG emissions. Impacts on local traffic movements could also result from trucks and construction equipment entering and leaving the construction sites and staging areas. There would be no adverse air quality impacts due to construction activities because mitigation measures would be incorporated into the project construction plan.

To minimize air quality impacts during construction, CTA would direct the contractor to prepare and implement a Dust Control Plan; retrofit diesel-powered equipment and vehicles to have emission control devices and use ultra-low sulfur diesel to control diesel particulate emissions; and develop a plan to allow construction trucks to access and egress the construction sites and staging area without adverse impacts on the local traffic. These plans would follow the guidelines from Illinois Department of Transportation (IDOT). The GHG emissions during construction could also be minimized by limiting truck and equipment idling times, maintaining equipment in proper working order, using alternative fuels for generators, reducing electricity consumption at the construction sites, and substituting single occupancy vehicle use with carpooling, shuttle vans, and transit passes for construction workers.

Updated July 27, 2015. In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix A of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix A supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the NEPA scoping process:

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
  - Right-of-Way (ROW) Option
  - East Option
  - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the CMAP Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

3.1 Regulatory Framework

3.1.1 Federal

Under authority of the Clean Air Act (CAA) and its amendments, the USEPA has established NAAQS for criteria pollutants to protect the public health and welfare (U.S. Congress 1970, 1977, 1990). The criteria pollutants that are of greatest significance to the transportation sector include CO, nitrogen dioxide (NO_2), ozone, particulate matter with an aerodynamic diameter of 10 micrometers and less (PM_{10}) and particulate matter with an aerodynamic diameter of 2.5 micrometers and less ($PM_{2.5}$). The NAAQS are summarized in Table 3-1. Although not shown in this table, the IAAQS are identical to the NAAQS.

3.1.2 State

The RLE Project and its associated stations would be in Cook County, Illinois. This county has been designated by the USEPA as a moderate nonattainment area with respect to the 8-hour ozone NAAQS. Cook County is also a nonattainment area for $PM_{2.5}$ and for lead. Illinois, through its SIP, specifies target dates for achieving compliance with the NAAQS, and identifies specific emission reduction goals for nonattainment or maintenance areas.

The RLE Project is included in a conforming RTP. Therefore, a regional analysis of project emissions would not be required for purposes of demonstrating compliance with the transportation conformity rules.

3.1.3 Local

There are no local ordinances that address transportation projects such as the RLE Project. There are also no local regulations that pertain to emissions of CAA criteria pollutants. Emissions of CO from parking facilities are not, for example, covered by local regulations.

Table 3-1: National Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Standard Type	Averaging Period	National	Form
Carbon Monoxide	Primary	1-hour	40 mg/m^3 (35 ppm)$^{(1)}$	Not to be exceeded more than once per year
		8-hour	10 mg/m^3 (9 ppm)	
Lead	Primary and Secondary	Rolling 3-Month	0.15 µg/m^3 $^{(2)}$	Not to be exceeded
Nitrogen Dioxide	Primary	1-hour	100 ppb	98th percentile, averaged over 3 years
	Primary and Secondary	Annual	53 ppb$^{(3)}$ (100 µg/m^3)	Annual arithmetic mean
Ozone	Primary and Secondary	8-hour	0.075 ppm$^{(5)}$	Annual fourth-highest daily maximum 8-hr concentration, averaged over 3 years
PM$_{10}$	Primary and Secondary	24-hour	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
PM$_{2.5}$	Primary and Secondary	Annual	15 µg/m^3 $^{(6)}$	Annual arithmetic mean, averaged over 3 years
	Primary and Secondary	24-hour	35 µg/m^3 $^{(6)}$	98th percentile, averaged over 3 years
Sulfur Dioxide	Primary	1-hour	75 ppb $^{(7)}$	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
	Secondary	3-hour	0.5 ppm	Not to be exceeded more than once per year

Source: USEPA, National Primary and Secondary Ambient Air Quality Standards (40 Code of Federal Regulations 50)

(1) The units of pollutant concentrations are in milligrams per cubic meter (mg/m^3), micrograms per cubic meter (µg/m^3), parts per million by volume (ppm), or parts per billion by volume (ppb).

2) Final rule signed October 15, 2008. The 1978 lead standard (1.5 µg/m^3 as a calendar quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in designated nonattainment areas for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved. The metropolitan Chicago area is no longer subject to the 1978 lead standard.

(3) The official level of the annual NO$_2$ standard is 0.053 ppm, equal to 53 ppb, which is shown here for the purpose of clearer comparison to the 1-hour NO$_2$ standard.

(4) USEPA revoked the 1-hour ozone standard in most areas of the United States.

(5) Final rule signed March 12, 2008. The 1997 ozone standard (0.08 ppm, annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years) and related implementation rules remain in place. EPA revoked the 1-hour ozone standard (0.12 ppm, not to be exceeded more than once per year) in most areas of the United States as of June 15, 2005, although some areas have continued obligations under that standard ("anti-backsliding"). The 1-hour ozone standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above 0.12 ppm is less than or equal to 1.

(6) The PM$_{2.5}$ standards are referenced to local conditions of temperature and pressure rather than standard conditions (760 mm and 25 degrees C).

(7) Final rule signed June 2, 2010. The 1971 annual and 24-hour sulfur dioxide standards were revoked in that same rulemaking. However, these standards remain in effect until 1 year after an area is designated for the 2010 standard, except in designated nonattainment areas for the 1971 standards, where the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standard are approved. The metropolitan Chicago area is no longer subject to the 1971 annual and 24-hour sulfur dioxide standards.

3.2 Impact Analysis Thresholds

3.2.1 During Construction

There is no quantitative basis for impact thresholds during construction, with the exception of the NAAQS for such pollutants as particulate matter (PM_{10} and $PM_{2.5}$) and CO. Most state transportation and environmental review agencies expect to see dust control and traffic management addressed and mitigated. The IDOT, for instance, has formal requirements for the contractor to prepare a Dust Control Plan, a Traffic Management Plan, and emission controls and low sulfur fuels for diesel-powered equipment.

3.2.2 During Operation

The impact thresholds during operation are the NAAQS. The thresholds for criteria pollutants during project operation are limited to controlling emissions that affect the nonattainment or maintenance status of the pollutants. For ozone nonattainment, the controls are focused on the precursors; namely, oxides of nitrogen (NOx) and volatile organic compounds (VOCs).

The SIP provides the emissions control strategy and implementation schedules for achieving and maintaining the NAAQS, such as the 8-hour ozone standard. If a proposed transportation project is in the RTP, and the RTP conforms to the SIP, then a separate conformity analysis of the specific project is not warranted because its impacts on region-wide emissions have already been taken into account.

Some states have impact thresholds for MSAT that are either related to emissions or exposure levels. But neither IEPA nor the FTA has any such requirements. Likewise, there are no quantitative impact thresholds for GHG emissions. Many states, including Illinois, have policies or guidance that encourage project proponents to minimize GHG emissions through conservation (using less energy) and use of alternative fuels (using less fossil fuel and more renewable energy such as solar or wind).

3.3 Area of Potential Impact

For an air quality assessment, impacts could be regional or localized; thus, the area of potential impact has both a regional and a local component. The regional component follows the analysis area adopted by the traffic analysis, which is a corridor bounded on the south by a varying boundary that includes 134th Street, on the north by 91st Street, on the west by a varying boundary that includes Halsted Street, and on the east by a varying boundary that includes I-94. The local component would be limited to the individual stations, their associated parking facilities, and nearby intersections affected by traffic entering and exiting the stations.

3.4 Methods

3.4.1 Air Quality Effects

The overall air quality effects from project operations are normally evaluated by quantifying the selected criteria pollutant emissions on a regional basis, and at local hot spots where motor vehicle congestion can take place. The RLE Project is included in a conforming RTP, and a corridor-wide emissions inventory analysis is therefore not necessary to demonstrate transportation conformity. The IEPA is trying to seek a re-designation of its $PM_{2.5}$ nonattainment status from USEPA. The RLE Project is not considered to be a project of local air quality concern (for example, a project that involves a significant increase in diesel buses or trucks). Under these circumstances, therefore, a qualitative hot spot analysis of $PM_{2.5}$ was prepared for the existing conditions, and the No Build Alternative, the BRT Alternative, the UPRR Rail Alternative (with its three options), and the Halsted Rail Alternative for the year 2030.

3.4.2 CO Hot Spot Analysis

A project-level CO hot spot analysis is performed as part of the NEPA process, for purposes of identifying and disclosing substantial impacts, and to evaluate possible mitigation measures. CO concentrations caused by local traffic at critical intersections must be estimated for comparison with the federal and state 1-hour and 8-hour CO standards. Concentrations must be estimated using the current, state-of-the-art approved emission factor programs and a dispersion model approved by USEPA to determine whether sensitive receptors would experience new or worsened violations of the federal CO standards.

Local CO dispersion modeling analysis was conducted at three "worst case" selected intersections for each project alternative. The "worst case" intersections for each alternative were selected based on level of service and total traffic volumes during the peak hour, as described in the USEPA's (1992) *Guideline for Modeling Carbon Monoxide from Roadway Intersections*. Table 3-2 presents the list of intersections selected for detailed analysis by project alternative. The listed ID numbers correspond to ID numbers in the *Transportation Technical Memorandum*. Figure 3-1 shows the location of each of the intersections analyzed.

The CO emission factors were developed using the USEPA's MOBILE6.2 program (USEPA 2004) and guidance from IEPA. Intersections were evaluated using EPA's CAL3QHC program (USEPA 1993). The estimated maximum 1-hour CO concentrations at each intersection were used to determine the 8-hour CO concentrations by multiplying the 1-hour concentration by a persistence factor approved by the IEPA of 0.7 (IEPA Personal communication 2012).

Total CO concentrations were derived by adding the modeled maximum concentrations to a background level to account for CO sources other than the traffic at the intersection being modeled. The background values represent worst-case, ambient CO levels that are assumed to occur independently of the vehicle traffic being analyzed. The nearest representative monitoring site to the project area is at 321 S. Franklin Street in Chicago. In consultation with IEPA (IEPA Personal communication 2012), background levels of 3.0 parts per million (ppm) for the 1-hour concentration and 1.7 ppm for 8-hour concentration were used based on the highest second-highest measured concentrations from the most recent 3 full years of monitoring data (2009–2011). These background levels are intended to represent worst-case urban conditions. The background concentrations were conservatively held constant for all analysis years and project alternatives. The maximum 1-hour and 8-hour CO concentrations (including an appropriate background concentration) were compared to the NAAQS for CO to determine impacts.

Table 3-2: Intersections Selected for the Detailed Air Quality Analysis by Alternative

Alternative	ID No.	Intersection Name	LOS	Total Volume
Existing	5	98th Place and Halsted Street	F	3,506

Figure 3-1: Traffic Intersections Analyzed in the Air Quality Analysis

3.4.3 Greenhouse Gases

A GHG is a gas in the atmosphere that absorbs and emits radiation within the thermal infrared range. Some GHGs are emitted by natural sources, such as respiration of plants and living organisms. GHGs can also be man-made, with sources such as the combustion of fossil fuels in transportation, residential space heating and utility power plants. Greenhouse gases act like a blanket around Earth, trapping energy in the atmosphere and causing it to warm. This phenomenon is called the greenhouse effect and is natural and necessary to support life on Earth. However, the buildup of GHG can change Earth's climate and result in dangerous effects on human health and welfare and on ecosystems. The primary GHG in the Earth's atmosphere are water vapor, carbon dioxide, methane, nitrous oxide, and ozone. In addition, sulfur hexafluoride (SF6) is also a known GHG and is used in transformers and electrical equipment. Water vapor is not regulated in any way and ozone is regulated under the CAA; therefore, these two compounds will not be addressed further in this technical memorandum.

Of the GHGs that are implicated in global climate change, CO_2 is the most dominant GHG in the atmosphere, by far. The GHGs differ in their ability to trap heat. For example, 1 ton of emissions of CO_2 has a different effect than 1 ton of emissions of methane. To compare emissions of different GHGs, emissions were computed using a weighting factor called a Global Warming Potential (GWP). To use a GWP, the heat-trapping ability of 1 metric ton (1,000 kilograms) of CO_2 is taken as the standard, and emissions are expressed in terms of CO_2e. Therefore, the GWP of CO_2 is 1. The GWP of methane is 21, while the GWP of nitrous oxide is 310. Total GHG emissions were determined by converting CO_2, methane (CH_4), and N_2O emissions from each of the major source categories into total CO_2e emissions by multiplying each compound by its respective GWP and summing the results.

The CO_2e emissions were estimated for the existing conditions and each of the project alternatives in 2030. The USEPA's MOBILE6.2 program was used to determine CO_2 emission factors from motor vehicles (cars, trucks, and buses). Emission factors for CH_4 and nitrous oxide N_2O were taken from Table 13.4 of *The Climate Registry - General Reporting Protocol* (TCR 2012). Vehicle fuel economy was assumed to be the national average of 23.8 miles per gallon (taken from Table 4-23 of the *National Transportation Statistics Report*, [Bureau of Transportation Statistics 2011]). Emission factors were combined with motor vehicle-generated VMT to estimate GHG emissions.

The quantitative assessment of project-related GHG benefits and/or impacts on climate change was conducted in accordance with the *Illinois Climate Change Advisory Group's Final Recommendations to the Governor (ICCAG 2007)*. These changes in GHG emissions reflect differences in VMT, travel speed, fuel consumption, and delay along the project corridor. This comparison of GHG emissions was supplemented by a qualitative assessment of project-related GHG benefits and/or impacts on global climate change. If any of the project alternatives were to lead to increased electricity use, this increase could lead to increased GHG emissions from local power plants supplying electricity to the grid.

The FTA issued new New Starts Guidance in January 2013 (Federal Transit Administration, *Proposed New Starts and Small Starts Policy Guidance*, January 9, 2013), which provides rates for converting VMT to CO, NOx, $PM_{2.5}$, VOCs, and GHG (CO_2e). The guidance was not available at the time this analysis was prepared; it was released long after the GHG analysis for this project was completed and the analysis has not been redone. The GHG emission factors used in this analysis are conservative (about 20 percent higher than the new FTA values). Thus, while the magnitude of the GHG impacts (actually improvements) would be smaller when using the FTA values, the overall conclusions would not change.

3.4.4 $PM_{2.5}$ Hot Spot Analysis

A hot spot analysis is defined in 40 Code of Federal Regulations (CFR) 93.101 as an estimation of likely future localized $PM_{2.5}$ pollutant concentrations and a comparison of those concentrations to the relevant air quality standards. A hot spot analysis assesses the air quality impacts on a scale smaller than an entire nonattainment or maintenance area. Such an analysis is a means of demonstrating that a transportation project meets CAA conformity requirements to support state and local air quality goals with respect to potential localized air quality impacts.

The qualitative $PM_{2.5}$ hot spot analysis followed USEPA's latest guidance (USEPA 2006). The analysis was based on direct emissions only. No precursor or secondary reaction products were taken into account. Based on the USEPA guidance, construction phase impacts were not required to be addressed in the $PM_{2.5}$ hot spot analysis. The method chosen to complete the $PM_{2.5}$ analysis is a combination of (1) performing and evaluating air quality studies for the proposed project location, and (2) using results of other studies for the general project location, including the Illinois SIP for $PM_{2.5}$ (CMAP 2008, 2010a, 2010b, 2010c). Various federal regulations requiring lower particulate emissions and fuel reformulations, including low-sulfur diesel fuels, have a significant role in reducing $PM_{2.5}$ emissions from mobile sources.

3.4.5 Mobile Source Air Toxics

Mobile source air toxics (MSAT) are compounds emitted from highway vehicles and non-road equipment and that are known or suspected to cause cancer or other serious health and environmental effects. Mobile sources are responsible for direct emissions of air toxics and contribute to precursor emissions that react to form secondary pollutants. The NEPA process requires the examination and avoidance of potential impacts on the natural and human environment when considering approval of proposed transportation projects.

The RLE Project would not have a high potential of MSAT effects, because direct emissions of MSAT from motor vehicles on the roadways are expected to decrease substantially with time. Project impacts on air toxics were assessed qualitatively, following the Federal Highway Administration's (FHWA's) 2009 guidelines (FHWA 2009). A qualitative analysis provides a basis for identifying and comparing the potential differences among MSAT emissions, if any, from the various alternatives. The qualitative assessment presented here is derived in part from a study conducted by the FHWA titled *A Methodology for Evaluating Mobile Source Air Toxic Emissions Among Transportation Project Alternatives* (FHWA 2011).

This assessment includes a description and discussion of national trend data projecting substantial overall reductions in emissions due to stricter engine and fuel regulations issued by USEPA, a discussion of information that is incomplete or unavailable for a project-specific assessment of MSAT impacts in compliance with the Council on Environmental Quality regulations (40 CFR 1502.22(b)), and a summary of current studies regarding the health impacts of MSAT, in compliance with 40 CFR 150.22(b). A qualitative comparison of MSAT from the various project alternatives was developed from the estimates of VMT, which were used as a surrogate for indicating trends in MSAT emissions.

3.4.6 Construction Impacts

Potential air quality impacts during construction were addressed qualitatively for construction vehicle emissions, including particulate matter (PM_{10} and $PM_{2.5}$) emissions and fugitive dust emissions. The focus of the assessment was to identify various mitigation measures to minimize or avoid these potential impacts.

3.4.7 Mitigation Measures

Mitigation of emissions during construction activities was addressed in Section 3.4.6. Following construction, operation of the project would result in no direct emissions. There could be an overall decrease in motor vehicle emissions due to diversion of passengers from motor vehicles to transit. During operation, none of the build alternatives would be likely to lead to any of the following:

- Emissions causing or contributing to a new violation of the NAAQS in the project area.
- An increase in the frequency or severity of an existing violation of the NAAQS.
- A delay of timely attainment of the NAAQS or other emissions reduction milestones in the project area.

Therefore, no mitigation measures would be needed for operation of the project.

Section 4
Affected Environment

As described in Section 3.1.2, Cook County, Illinois has been designated as a moderate nonattainment area with respect to the 8-hour ozone NAAQS. The IEPA, through the SIP, specifies target dates for achieving compliance with the ozone standard, and identifies specific emission reduction goals for NO_2 and non-methane hydrocarbons, which are precursors of ozone. The USEPA has designated Cook County a nonattainment area for $PM_{2.5}$, but current air quality data show that Cook County is meeting the $PM_{2.5}$ NAAQS. The IEPA has requested a redesignation, but to date, the USEPA has not acted on this request. The USEPA has designated a portion of Cook County a nonattainment area for lead, but that nonattainment area is not in the project area.

Because the project would occur in a “moderate” ozone nonattainment area, it is the FTA's responsibility, as the federal lead agency, to ensure that the proposed project conforms to the Illinois SIP. A "conforming" project is defined as one that meets the SIP's objectives of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of those standards.

Federally funded transit projects are subject to the USEPA transportation conformity rule (40 CFR Part 93 Subpart A). Conformity is demonstrated by showing that the proposed project is included in a conforming RTP and also meets the project-level requirements contained in the transportation conformity rule. The Long-Range RTP for the region is the *2030 Regional Transportation Plan for Northeastern Illinois* ([2030 RTP] CMAP 2008). The Board of the CMAP and the Metropolitan Planning Organization Policy Committee approved an update to the 2030 RTP on October 8 and October 9, 2008, respectively. The region’s TIP, *Federal Fiscal Year 2010–2015 Transportation Improvement Program* (CMAP 2010) was accepted by the U.S. Department of Transportation on October 25, 2010, following approvals by the CMAP Metropolitan Planning Organization Policy Committee, IDOT, IEPA, and USEPA. All of the projects in the TIP are included in the conforming 2030 RTP. The 2030 RTP was replaced by the *GO TO 2040* comprehensive regional plan (CMAP 2010) in January 2012. The updated RTP (*GO TO 2040)* continues to carry the RLE Project. Because the RLE Project is in a conforming RTP, a regional analysis of project emissions is not required to demonstrate compliance with the transportation conformity rule.

4.1 Measured Ambient Air Quality Concentrations

This section summarizes measured ambient air quality data for the region including the project area. The IEPA maintains a statewide network of monitoring stations that continuously measure pollutant concentrations in the ambient air. These stations provide data to assess compliance with the NAAQS and the IAAQS and to evaluate the effectiveness of pollution control strategies. The pollutants of concern are CO, NOx, Ozone, PM_{10}, $PM_{2.5}$, and sulfur dioxide. Table 4-1 presents the maximum ambient concentrations for these pollutants measured at representative monitoring stations nearest to the project corridor for the most recently available full year of data, calendar year 2011. As shown in Table 4-1, except for one exceedance of the 8-hour ozone at the Lawndale Street Station, there were no exceedances in the project area of any of the NAAQS or IAAQS in 2011.

Table 4-1: Measured Ambient Air Quality in the Project Area for 2011

Pollutant	Monitor Location	Averaging Period	Monitored Value	Standard
Carbon Monoxide	321 S. Franklin (Chicago, IL)	1-hour	3.3 ppm	35.0 ppm
Carbon Monoxide	321 S. Franklin (Chicago, IL)	8-hour	1.5 ppm	9.0 ppm
Nitrogen Dioxide	321 S. Franklin (Chicago, IL)	1-hour	89 ppb	100 ppb
Ozone	7801 Lawndale (Chicago, IL)	8-hour	**0.082 ppm**	0.075 ppm
PM_{10}	750 Dundee Rd. (Northbrook, IL)	24-hour	38 µg/m^3	150 µg/m^3
$PM_{2.5}$	3535 E.114th St. (Chicago, IL)	24-hour	28.5 µg/m^3	35 µg/m^3
$PM_{2.5}$	3535 E.114th St. (Chicago, IL)	Annual	12.6 µg/m^3	15.0 µg/m^3
Sulfur Dioxide	7801 Lawndale (Chicago, IL)	1-hour	29 ppb	75 ppb
Sulfur Dioxide	7801 Lawndale (Chicago, IL)	24-hour	7 ppb	140 ppb

Source: EPA, Airdata website (http://www.epa.gov/airdata), Monitor Values Report accessed October 15, 2012.
Units of measure are parts per million (ppm) or parts per billion (ppb) by volume, and micrograms per cubic meter of air (µg/m3).
Values in **bold** exceed the applicable standard, but do not constitute a violation.

4.2 CO Hot Spot Analysis

Following the methods described in Section 3.4.2, a CO hot spot analysis was conducted for the existing conditions using EPA's MOBILE6.2 emission factors program and EPA's CAL3QHC dispersion model. A summary of the modeled maximum 1-hour CO concentrations at each of the street intersections selected for analysis (98th Place and Halsted Street, 103rd Street and Vincennes Avenue and Beverly Avenue, and 119th Street and Ashland Avenue) is presented in Table 4-2. These concentrations include a background level of 3.0 parts per million (ppm), which was determined to remain constant with time. The 8-hour CO concentrations were estimated by multiplying the modeled 1-hour results (without the background) by a persistence factor of 0.7 and adding a background of 1.7 ppm (also assumed to remain constant with time). A summary of the modeled maximum 8-hour CO concentrations for the selected intersections for the existing conditions is also presented in Table 4-2.

Table 4-2: Estimated Maximum 1-Hour and 8-Hour Carbon Monoxide Concentrations for the Existing Conditions

ID No.	Intersection Description	Maximum 1-hour* (ppm)	Maximum 8-hour** (ppm)
5	98th Place and Halsted Street	5.7	3.6
14	103rd Street and Vincennes Avenue and Beverly Avenue	5.1	3.2
59	119th Street and Ashland Avenue	5.0	3.1

Source: KM Chng Environmental Inc., 2012.

* Values include a background 1-hour CO concentration of 3.0 ppm.

** Values include a background 8-hour CO concentration of 1.7 ppm.

ppm = parts per million

As shown in Table 4-2, the maximum modeled 1-hour CO concentration at any of the three intersections analyzed for the existing conditions was estimated to be 5.7 ppm, including a background concentration of 3.0 ppm, for the intersection of 98th Place and Halsted Street. This maximum 1-hour CO concentration occurred at a receptor located along the southbound approach of Halsted Street about 3 meters from the intersection with 98th Place. All of the modeled 1-hour CO concentrations for the existing conditions were well below the 1-hour CO National and Illinois standard of 35 ppm.

The maximum 8-hour CO concentration for the existing conditions occurred at the same receptor at the same intersection as the 1-hour concentration and was estimated to be 3.6 ppm, including a background CO concentration of 1.7 ppm. All of the modeled 8-hour CO concentrations for the existing conditions were also well below the corresponding 8-hour CO National and Illinois standards of 9 ppm.

4.3 Greenhouse Gas Analysis

A GHG is a gas in the atmosphere that absorbs and emits radiation within the thermal infrared range. The quantitative assessment of project-related GHG benefits and/or impacts on climate change presented here was conducted to reflect the changes in GHG emissions based on differences in VMT, travel speed, fuel consumption, and delay along the project corridor.

The six-county Chicago metropolitan area, including Cook County, was estimated to have emissions of about 105 million metric tons of CO_2e in calendar year 2000. The transportation sector was responsible for up to 31 percent of the CO_2 emissions, and on-road vehicles generated approximately 90 percent of the CO_2e emissions from transportation sources (McGraw et al. 2010).

The GHG emissions in the project area for the existing conditions in 2012 were estimated to be about 53,048,993 tons per year (tpy) of CO_2, about 1,704 tpy of CH4, and about 2,613 tpy of N_2O.

When converted to total CO_2e using the GWP conversion factors, the total GHG is 53,894,714 tpy of CO_2e.

4.4 $PM_{2.5}$ Hot Spot Analysis

The method chosen to complete the qualitative $PM_{2.5}$ analysis is a combination of (1) performing and evaluating air quality studies for the proposed project location, and (2) using results of other studies for the general project location (including the Illinois SIP for $PM_{2.5}$).

Diesel particulate matter is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is commonly found throughout the environment and is estimated by EPA to contribute to the human health risk. Diesel exhaust is composed of two phases, either gas or particle and both phases contribute to the risk. The gas phase is composed of many of the urban hazardous air pollutants, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase also has many different types of particles that can be classified by size or composition. The sizes of diesel particulates that are of greatest health concern are those that are in the categories of fine and ultra-fine particles. The composition of these fine and ultra-fine particles may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on road diesel engines of trucks, buses and cars and the off road diesel engines that include locomotives, marine vessels, and heavy duty equipment.

Diesel exhaust causes health effects from both short-term or acute exposures and also long-term chronic exposures, such as repeated occupational exposures. The type and severity of health effects depends upon several factors including the amount of chemical one is exposed to and the length of time one is exposed. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel particulate matter but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects. Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat and lungs, and some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a likely carcinogen. Human epidemiological studies demonstrate an association between exposure to diesel exhaust and increased lung cancer rates in occupational settings.

The USEPA has designated Cook County as a nonattainment area for $PM_{2.5}$, but current air quality data show that Cook County is meeting the $PM_{2.5}$ NAAQS. As noted above, the IEPA has also requested a redesignation to attainment status, but to date, the USEPA has not acted on this request. Following joint guidance issued by EPA and FHWA (USEPA 2006), the following qualitative assessment of $PM_{2.5}$ hot spot analysis was conducted. Air quality monitoring of $PM_{2.5}$ in Cook County and across the state shows a decrease in $PM_{2.5}$ concentrations of 24 percent over the past decade (2001–2010). For the existing conditions, monitored ambient $PM_{2.5}$ concentrations in the vicinity of the RLE Project show no exceedances of the $PM_{2.5}$ standard in 2011 (the most recent year for which complete data is available).

4.5 Mobile Source Air Toxics Analysis

Mobile source air toxics are emitted from motor vehicles and non-road construction equipment. The MSAT can be present in the fuels, formed from incomplete combustion of fossil fuels, or formed as secondary reaction products from the combustion emissions in the atmosphere. A qualitative comparison of MSAT from the various project alternatives was developed from the estimates of VMT, which were used as a surrogate for indicating trends in MSAT, and the comparisons are provided below. Although a qualitative analysis cannot identify and measure health impacts from MSAT, it provides a basis for comparing and contrasting the various alternatives with respect to MSAT emissions. The qualitative analysis of MSAT for this project assumes the change in the amount of MSAT emitted between the No Build and the RLE Project Alternatives will be proportional to the change in the project-related VMT.

Mobile source air toxics are a subset of the 188 air toxics defined by the CAA. Most air toxics originate from human-made sources, including on-road mobile sources, non-road mobile sources (e.g., airplanes), and stationary sources (e.g., factories or refineries). Metal air toxics also result from engine wear or from impurities in oil or gasoline. The USEPA has assessed the list of 188 air toxics in its latest rule on the Control of Hazardous Air Pollutants from Mobile Sources and identified a group of 93 compounds emitted from mobile sources that are listed in its Integrated Risk Information System. There currently are no established ambient air quality standards for MSAT. In accordance with the FHWA's guidance regarding air toxic analysis (FHWA 2009), a qualitative assessment of MSAT is also included in the air quality analysis.

Of the many MSAT that are regulated by the USEPA, six are judged to be significant for transportation sources partly because of their suspected carcinogenicity and their relative abundance in vehicle exhaust. According to USEPA's *Control of Emissions of Hazardous Air Pollutants from Mobile Sources Final Rule* (USEPA 2007), these six priority MSAT include benzene, acrolein, formaldehyde, 1,3-butadiene, acetaldehyde, and diesel particulate matter. As a result of the FMVECP (40 USC § 7521), the FHWA estimates that even with an assumed 64 percent increase in VMT from 2000 to 2020, emissions of the various non-diesel MSAT would decrease by 57 to 65 percent. For diesel particulates and diesel organic gases, the reduction was estimated at 87 percent. A qualitative comparison of MSAT from the various project alternatives was developed from the estimates of VMT, which were used as a surrogate for indicating trends in MSAT emissions.

Section 5
Impacts and Mitigations

This section describes the analyses performed and assesses the results in comparison to the No Build Alternative.

5.1 No Build Alternative

The No Build Alternative in 2030 is defined as the existing transportation system plus any committed transportation improvements that are already in the CMAP Fiscal Year 2010–2015 TIP. The TIP projects within the project area include four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. No new infrastructure would be constructed as part of the No Build Alternative.

5.1.1 Permanent Impacts and Mitigations – No Build Alternative

With the No Build Alternative, there would be no changes in ridership due to the proposed RLE Project; therefore, there would be no changes in direct emissions due to the proposed project. The Red Line trains run on electricity; therefore, they cause no direct emissions. Their electricity comes from the electric utility grid, which may include local, fossil-fueled power plants. No increase in electrical power consumption would be expected under the No Build Alternative; therefore, no change in indirect emissions would be expected with the No Build Alternative.

5.1.1.1 CO Hot Spot Analysis

A summary of the modeled maximum 1-hour CO concentrations at all of the street intersections selected for analysis is presented in Table 5-1. A summary of the modeled maximum 8-hour CO concentrations for the selected intersections is presented in Table 5-2. For comparison purposes, the results for all project alternatives are presented in these tables. The three "worst case" intersections for each alternative were selected based on level of service (LOS) and total traffic volumes during the peak hour, as required by USEPA guidance (USEPA 1992). These intersections may not be the same for each alternative based on the traffic analysis LOS results.

As shown in Table 5-1, the maximum modeled 1-hour CO concentration at any of the three intersections analyzed for the No Build Alternative (98th Place and Halsted Street, 103rd Street and Vincennes Avenue and Beverly Avenue, and 119th Street and Ashland Avenue) was estimated to be 5.1 ppm, including a background concentration of 3.0 ppm, and occurred at the intersection of 98th Place and Halsted Street. This maximum 1-hour CO concentration occurred at a receptor located along the eastbound departure of 98th Place about 3 meters from the intersection with Halsted Street. All of the modeled 1-hour CO concentrations for the No Build Alternative were well below the 1-hour CO National and Illinois standards of 35 ppm.

Table 5-1: Summary of Estimated Maximum 1-hour Carbon Monoxide Concentrations* by Project Alternative

ID No.	Intersection Description	Existing (ppm)	No Build (ppm)	BRT (ppm)	UPRR (ppm)	Halsted (ppm)
5	98th Place and Halsted Street	5.7	5.1	5.1	5.1	5.1
14	103rd Street and Vincennes Avenue and Beverly Avenue	5.1	4.9	na	na	na
59	119th Street and Ashland Avenue	5.0	4.6	4.7	na	na
62	119th Street and State Street	na	na	na	3.9	na
68	127th Street and Halsted Street	na	na	na	na	4.6
70	127th Street and Wallace Street and Vermont Avenue	na	na	na	na	4.7
73	130th Street and Indiana Avenue	na	na	4.4	4.8	na

* Values include a background 1-hour CO concentration of 3.0 ppm.
na means this intersection was not analyzed for this alternative.
ppm = parts per million, BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad

As shown in Table 5-2, the maximum 8-hour CO concentration for the No Build Alternative was for the same receptor at the same intersection as the 1-hour concentration and was estimated to be 3.2 ppm, including a background CO concentration of 1.7 ppm. All of the modeled 8-hour CO concentrations for the No Build Alternative were also well below the corresponding 8-hour CO National and Illinois standards of 9 ppm.

Table 5-2: Summary of Estimated Maximum 8-Hour Carbon Monoxide Concentrations* by Project Alternative

ID No.	Intersection Description	Existing (ppm)	No Build (ppm)	BRT (ppm)	UPRR (ppm)	Halsted (ppm)
5	98th Place and Halsted Street	3.6	3.2	3.2	3.2	3.2
14	103rd Street and Vincennes Avenue and Beverly Avenue	3.2	3.0	na	na	na

na means this intersection was not analyzed for this alternative.

ppm = parts per million, BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad

5.1.1.2 Greenhouse Gas Analysis

A quantitative assessment of project-related GHG benefits and/or impacts on climate change was conducted to reflect the changes in GHG emissions based on differences in VMT, travel speed, fuel consumption, and delay along the project corridor. There would be no growth in VMTs or delay due to the RLE Project in the No Build Alternative. Following the methods described in Section 3.4.3, emissions of GHG were estimated for each of the project alternatives.

A summary of the results of that analysis is presented in Table 5-3 by alternative for comparison purposes. The No Build Alternative would not be expected to change the ridership or to result in changes in diversion from motor vehicles to trains. However, some growth in VMT for the project corridor that would be unrelated to the proposed project would still take place. The increases in regional VMT would lead to increases in GHG (CO_2e) emissions under the No Build Alternative.

Table 5-3: Project-Related Greenhouse Gas Emissions by Project Alternative

Alternative	CO_2 (tpy)	CH_4 (tpy)	N_20 (tpy)	Total GHG (tpy)	GWP* (tons CO2e/year)
Existing Conditions	53,048,993	1,704	2,613	53,053,310	53,894,714
No Build Alternative	62,539,690	1,980	3,036	62,544,707	63,522,530
BRT Alternative	62,532,636	1,980	3,036	62,537,652	63,515,365
UPRR Rail Alternative	62,527,538	1,979	3,036	62,532,553	63,510,186
Halsted Rail Alternative	62,528,056	1,979	3,036	62,533,071	63,510,713

Source: KM Chng Environmental Inc., 2012.
Notes:
CO_2 = carbon dioxide, CH_4 = methane, N_2O = nitrous oxide, GHG = greenhouse gas, tpy = tons per year, GWP = Global Warming Potential in units of tons of carbon dioxide equivalents per year (CO_2e/year), BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad

With the No Build Alternative, estimated project-related GHG emissions would be about 62,539,690 tpy of CO_2, about 1,980 tpy of CH4, and about 3,036 tpy of N_2O. These emissions would be an increase of 17.9, 16.1, and 16.2 percent, respectively when compared to the existing conditions GHG emissions. The sum of project-related GHG emissions for the No Build Alternative is 62,544,707 tpy or about 18 percent more than the 53,053,310 tpy of total project-related GHG emissions for the existing conditions.

When converted to total CO_2e emissions using the GWP conversion factors, the total emissions of project-related CO_2e for the No Build Alternative would be 63,522,530 tpy of CO_2e. Compared to the existing conditions CO_2e emissions of 53,894,714 tpy, this would be an increase of about 18 percent.

5.1.1.3 $PM_{2.5}$ Hot Spot Analysis

For the No Build Alternative in 2030, project-related $PM_{2.5}$ emissions in the Northeastern Illinois Nonattainment Area (CMAP 2008) were estimated to be 1,981 tpy. Specifically, $PM_{2.5}$ emissions factors for motor vehicles in the Chicago area are expected to decline by over 38 percent between 2012 and 2030. However, VMT in the project area in the No Build Alternative are expected to increase compared to the existing conditions VMT by about 14 percent. When taken together, these two factors would result in a reduction in regional $PM_{2.5}$ emissions by 2030. In addition to the federal exhaust emissions control programs and fuel reformulation programs, statewide efforts to reduce congestion and vehicle idling are also expected to have a direct benefit by reducing $PM_{2.5}$ concentrations at the local level.

In its conformity analysis, CMAP concluded that the *GO TO 2040* plan and the TIP meet all applicable requirements for conformity for the annual $PM_{2.5}$ standard; *GO TO 2040* and the TIP have also been recommended for approval by USDOT.

5.1.1.4 MSAT Analysis

A qualitative comparison of MSAT from the various project alternatives was developed from the estimates of VMT, which were used as a surrogate for indicating trends in MSAT emissions, and the comparisons are provided below.

The No Build Alternative would not be expected to change the ridership or result in substantial diversion from motor vehicles to trains. The EPA's FMVECP is expected to reduce MSAT emissions by about 54 percent in the project area between 2012 and 2030. However, VMT in the project area in the No Build Alternative are expected to increase compared to the existing conditions VMT by about 14 percent. When taken together, these two factors would result in a reduction in regional MSAT emissions for the No Build Alternative compared to the existing conditions.

5.1.2 Construction Impacts and Mitigations – No Build Alternative

Under the No Build Alternative, no new infrastructure would be constructed. However, it is assumed that necessary repairs to keep the Red Line running would take place. Therefore, there would be no new emissions due to construction, except for projects that were already planned. Potential impacts on air quality due to the No Build Alternative would be minimal and no mitigation is proposed for the No Build Alternative.

5.1.3 Cumulative Impacts and Mitigations – No Build Alternative

The only project that might be related to the No Build Alternative with respect to air quality impacts is CTA's Red and Purple Modernization (RPM) Project. Without improvements to the existing Red Line, the RLE might not be able to achieve its full potential. The impact on air quality would not be adverse.

5.2 Bus Rapid Transit Alternative

The proposed Bus Rapid Transit Alternative (BRT Alternative) is a BRT route that would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue via 95th Street, Michigan Avenue, 127th Street, Indiana Avenue, and 130th Street. Four stops with improved bus shelters would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. The bus route would continue through Altgeld Gardens with stops at 131st Street and Langley Avenue, 131st Street and Corliss Avenue, 131st Street and Ingleside Avenue, 132nd Street and Ellis Avenue, 133rd Street and Ellis Avenue, and 133rd Place and Corliss Avenue. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

The Red Line trains run on electricity; therefore, they cause no direct emissions. Their electricity comes from the electric utility grid, which may include local, fossil-fueled power plants. No increase in direct project-related emissions from Red Line Trains would be expected under the BRT Alternative. However, with the increase in bus miles travelled, a slight change in direct emissions would be expected with the BRT Alternative.

5.2.1.1 CO Hot Spot Analysis

A summary of the modeled maximum 1-hour CO concentrations at each of the street intersections selected for analysis (98th Place and Halsted Street, 103rd Street and Vincennes Avenue and Beverly Avenue, and 119th Street and Ashland Avenue) is presented in Table 5-1. A summary of the modeled maximum 8-hour CO concentrations for the selected intersections is also presented in Table 5-2. The three “worst case” intersections for each alternative were selected based on LOS and total traffic volumes during the peak hour, as required by USEPA guidance (USEPA 1992). These intersections may not be the same for each alternative based on the traffic analysis LOS results.

As shown in Table 5-1, the maximum modeled 1-hour CO concentration at any of the three intersections analyzed for the BRT Alternative was estimated to be 5.1 ppm, including a background concentration of 3.0 ppm, and occurred at the intersection of 98th Place and Halsted Street. This maximum 1-hour CO concentration occurred at a receptor located along the eastbound departure of 98th Place about 3 meters from the intersection with Halsted Street. All of the modeled 1-hour CO concentrations for the BRT Alternative were well below the 1-hour CO National and Illinois standards of 35 ppm.

As also shown in Table 5-2, the maximum 8-hour CO concentration for the BRT Alternative occurred at the same receptor at the same intersection as the 1-hour concentration and was estimated to be 3.2 ppm, including a background CO concentration of 1.7 ppm. All of the modeled 8-hour CO concentrations for the BRT Alternative were also well below the corresponding 8-hour CO National and Illinois standards of 9 ppm.

Based on the above analysis, no mitigation measures would be required for any of the traffic intersections analyzed for the BRT Alternative. Also, no adverse air quality impacts from CO emissions are expected to occur with this alternative.

5.2.1.2 Greenhouse Gas Analysis

This quantitative assessment of project-related GHG benefits and/or impacts on climate change presented here was conducted based on the methods described in Section 3.4.3. The BRT Alternative is expected to cause a small change in ridership to divert from motor vehicles to transit, and to also cause a very small increase in additional BRT Alternative bus VMT. This would lead to a small decrease in VMT of 31,182. Thus, this decrease in VMT would lead to a small decrease in GHG emissions under the BRT Alternative.

As shown in Table 5-3, the estimated BRT Alternative project-related GHG emissions would be about 62,532,636 tpy of CO_2, about 1,980 tpy of CH4, and about 3,036 tpy of N_2O. When compared to the existing conditions, project-related GHG emissions for the BRT Alternative would represent an increase of over 16 percent for each pollutant. However, when the BRT Alternative GHG emissions are compared to the No Build Alternative GHG emissions, they would be smaller by about 0.01 percent for each pollutant.

The sum of project-related GHG emissions for the BRT Alternative is 62,537,652 tpy or about 15 percent higher than the 53,053,310 tpy of total project-related GHG emissions for the existing conditions. However, the sum of project-related GHG emissions for the BRT Alternative is about 0.01 percent less than the 62,544,707 tpy of total project-related GHG emissions for the No Build Alternative.

When converted to total CO_2e emissions using the GWP conversion factors, the total project-related GHG emissions for the BRT Alternative would be 63,515,365 tpy of CO_2 equivalents. Total project-related CO_2e emissions for the BRT Alternative would be about 15 percent higher than the 53,894,714 tpy of total project-related CO_2e emissions for the existing conditions. However, compared to the No Build Alternative, the CO_2e emissions for the BRT Alternative would be about 0.01 percent lower in total CO_2e emissions. Therefore, no adverse air quality impacts from GHG emissions are anticipated due to this alternative.

5.2.1.3 $PM_{2.5}$ Hot Spot Analysis

The $PM_{2.5}$ emissions factors for motor vehicles in the Chicago area are expected to decline by over 38 percent between 2012 and 2030. In addition, VMT in the project area in the BRT Alternative (including VMT generated by additional bus operations) are expected to be slightly lower than in the No Build Alternative VMT, by about 0.01 percent, due to passenger diversions. When taken together, these two factors would result in the BRT Alternative having slightly lower regional $PM_{2.5}$ emissions than the No Build Alternative. In addition to the federal exhaust emissions control programs and fuel reformulation programs, statewide efforts to reduce congestion and vehicle idling are also expected to have a direct benefit by reducing $PM_{2.5}$ concentrations at the local level.

In its conformity analysis, CMAP concluded that the *GO TO 2040* plan and the TIP meet all applicable requirements for conformity for the annual $PM_{2.5}$ standard; *GO TO 2040* and the TIP have also been recommended for approval by USDOT. Therefore, no adverse air quality impacts from $PM_{2.5}$ emissions are anticipated due to this alternative.

5.2.1.4 MSAT Analysis

The EPA's FMVECP is expected to reduce MSAT emissions by about 54 percent in the project area between 2012 and 2030. In addition, VMT in the project area with the BRT Alternative (including VMT generated by additional bus operations) are expected to be slightly lower than in the No Build Alternative VMT, by about 0.01 percent, due to passenger diversions. When taken together, these factors would result in the regional MSAT emissions with the BRT Alternative being slightly lower than with the No Build Alternative. Therefore, no adverse air quality impacts from MSAT emissions are anticipated due to this alternative.

5.2.2 Construction Impacts and Mitigations – Bus Rapid Transit Alternative

Construction activities for the BRT Alternative would be grouped by type of work and location. Overall schedule and coordination would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street Yard and Shop, and to maintain vehicular traffic on affected expressways and roadways. Construction for the BRT corridor could be sequenced to coordinate with CTA operations at the 95th Street Terminal.

Emissions from construction equipment would occur during site preparation activities such as grading, installing curbs, or grubbing and removal of vegetation to prepare a site for construction. Impacts during construction would be primarily associated with fugitive dust and emissions from on-road and non-road vehicles. The equipment producing these emissions could include haul trucks, concrete trucks, front-end loaders, excavators, cranes, drill rigs, compressors, flatbed trucks, and generators. Most state air quality agencies, including IEPA, have strict guidelines for controlling fugitive dust (usually by good housekeeping practices), diesel particulate emissions (by exhaust emission controls and use of low sulfur fuels), and GHG emissions (by limiting equipment operations such as excessive idling and by using alternative fuels).

Construction activities can also result in traffic disruption, rerouting, and temporary shutdown of traffic. Traffic disruption, such as decreased roadway capacity or detouring, can lead to increased traffic congestion, thereby increasing motor vehicle exhaust emissions on nearby roadways, and resulting in elevated localized pollutant concentrations. Temporary shutdown of traffic would occur at nighttime and during low traffic volume intervals per IDOT approval. Work would be sequenced to minimize impacts on adjacent roadways and commercial and residential buildings. Existing utilities would be protected during construction of the BRT stations, park & ride facilities, and traffic signal improvements.

Proper traffic management during the construction period would mitigate any potential adverse effects. This would include finding less congested routes for construction-related truck traffic, creating temporary detours for regular roadways where capacities have been diminished, providing traffic control, routing trucks away from residential neighborhoods, and restricting construction activities during hours of high traffic volumes on the existing roadways. Staging areas and worker parking areas would be established away from sensitive receptors.

Many state agencies such as IDOT require the contractor to develop a Dust Control Plan that would address in detail how dust would be controlled at all times at the construction site, the staging areas, and the access and egress routes. The agencies also require all diesel-powered equipment and vehicles to be retrofitted with emissions control devices and to use ultra-low sulfur diesel to control diesel particulate emissions.

CTA would require the contractor to develop a plan and schedule to allow construction trucks to access and egress the construction sites and staging areas without excessive disruption and impacts on residences and commercial establishments.

Compared with the other two build alternatives, construction activities for the BRT Alternative would be noticeably fewer and smaller in scale. With the use of appropriate mitigation measures as described above, no violations of any of the IAAQS are anticipated for this alternative. Therefore, with appropriate mitigation measures in place, no adverse air quality impacts due to construction activities are anticipated due to this alternative.

5.2.3 Cumulative Impacts and Mitigations – Bus Rapid Transit Alternative

The only project that might be related to the BRT Alternative with respect to air quality impacts is CTA's RPM Project. Without improvements to the existing Red Line, the RLE might not be able to achieve its full potential. The impact on air quality with or without the RPM Project would not be adverse.

5.3 Union Pacific Railroad Rail Alternative

The UPRR Alternative would extend the heavy rail transit Red Line from the existing 95th Street Terminal to 130th Street, just west of I-94. The UPRR Rail Alternative would be an extension of the existing Red Line. Three UPRR Rail Alternative options for the segment between I-57 and the CN/Metra Electric tracks are assessed here:

- ROW Option: CTA tracks placed in the UPRR ROW.
- East Option: CTA tracks placed immediately adjacent to and east of the UPRR ROW.
- West Option: CTA tracks placed immediately adjacent to and west of the UPRR ROW.

The air quality analysis presented here applies to the project area as a whole. Because nearly all of the project-related air pollutant emissions would come from motor vehicles and because the project-related motor vehicles would move throughout the entire project area, the results of the air quality analysis apply equally to all of the UPRR options mentioned above, as well as to the 120th Street yard and shop. That is, it makes no difference in the analysis whether the Red Line Trains would be on the UPRR ROW, on the east side, or on the west side of the ROW; the pollutant emissions would be the same in each case. In addition, the air pollutant emissions associated with the 120th Street yard and shop would be quite unsubstantial. Further separate analysis of the 120th Street yard and shop was not conducted. Therefore, the UPRR Rail Alternative and all of its options are discussed as only one alternative.

5.3.1 Permanent Impacts and Mitigations – Union Pacific Railroad Rail Alternative

The Red Line trains run on electricity; therefore, they cause no direct emissions. Their electricity comes from the electric utility grid, which may include local, fossil-fueled power plants. An increase in indirect emissions due to electrical power consumption by the Red Line trains would be expected under the UPRR Rail Alternative.

5.3.1.1 CO Hot Spot Analysis

A summary of the modeled maximum 1-hour CO concentrations at each of the street intersections selected for analysis (98th Place and Halsted Street, 119th Street and State Street, and 130th Street and Indiana Avenue) is presented in Table 5-1. A summary of the modeled maximum 8-hour CO concentrations for the selected intersections is also presented in Table 5-2. The three "worst case" intersections for each alternative were selected based on LOS and total traffic volumes during the peak hour, as required by USEPA guidance (USEPA 1992). These intersections may not be the same for each alternative based on the traffic analysis LOS results.

As shown in Table 5-1, the maximum modeled 1-hour CO concentration at any of the three intersections analyzed for the UPRR Rail Alternative was estimated to be 5.1 ppm, including a background concentration of 3.0 ppm, and occurred at the intersection of 98th Place and Halsted Street. This maximum 1-hour CO concentration occurred at a receptor located along the eastbound departure of 98th Place about 3 meters from the intersection with Halsted Street. All of the modeled 1-hour CO concentrations for the UPRR Rail Alternative were well below the 1-hour CO National and Illinois standards of 35 ppm.

As also shown in Table 5-2, the maximum 8-hour CO concentration for the UPRR Rail Alternative occurred at the same receptor at the same intersection as the 1-hour concentration and was estimated to be 3.2 ppm, including a background CO concentration of 1.7 ppm. All of the modeled 8-hour CO concentrations for the UPRR Rail Alternative were also well below the corresponding 8-hour CO National and Illinois standards of 9 ppm.

Based on the above analysis, no mitigation measures would be required for any of the traffic intersections analyzed for the UPRR Rail Alternative. Also, no adverse air quality impacts from CO emissions are expected to occur with this alternative.

5.3.1.2 Greenhouse Gas Analysis

This quantitative assessment of project-related GHG benefits and/or impacts on climate change presented here was conducted based on the methods described in Section 3.4.3. The UPRR Rail Alternative is expected to cause a small change in ridership to divert from motor vehicles to trains leading to a small decrease in VMT of 53,718. Thus, this decrease in VMT would lead to a small decrease in GHG emissions under the UPRR Rail Alternative.

As shown in Table 5-3, the UPRR Rail Alternative project-related GHG emissions would be about 62,527,538 tpy of CO_2, about 1,979 tpy of CH4, and about 3,036 tpy of N_2O. When compared to the existing conditions, project-related GHG emissions for the UPRR Rail Alternative would be an increase of over 16 percent for each pollutant. However, when compared to the No Build Alternative GHG emissions, these results would be 0.02 percent lower for each pollutant.

When converted to total CO_2e using the GWP conversion factors, the total of GHG emissions for the UPRR Rail Alternative would be 63,510,186 tpy of CO_2 equivalents. Total project-related CO_2e emissions for the UPRR Rail Alternative would be about 17.9 percent higher than the 53,894,714 tpy of total project-related CO_2e emissions for the existing conditions. However, compared to the

No Build Alternative, GHG emissions for the UPRR Rail Alternative would be about 0.02 percent lower in total CO_2e emissions. Therefore, no adverse air quality impacts from GHG emissions are anticipated due to this alternative.

5.3.1.3 $PM_{2.5}$ Hot Spot Analysis

The $PM_{2.5}$ emissions factors for motor vehicles in the Chicago area are expected to decline by over 38 percent between 2012 and 2030. In addition, VMT in the project area in the UPRR Rail Alternative would be slightly lower than the No Build Alternative VMT, by about 0.02 percent, due to passenger diversions to the Red Line. When taken together, these two parameters would result in reduction in existing regional $PM_{2.5}$ emissions with the UPRR Rail Alternative. In addition to the federal exhaust emissions control programs and fuel reformulation programs, statewide efforts to reduce congestion and vehicle idling are also expected to have a direct benefit by reducing $PM_{2.5}$ concentrations at the local level.

In its conformity analysis, CMAP concluded that the *GO TO 2040* plan and the TIP meet all applicable requirements for conformity for the annual $PM_{2.5}$ standard; *GO TO 2040* and the TIP have also been recommended for approval by USDOT. Therefore, no adverse air quality impacts from $PM_{2.5}$ emissions are anticipated due to this alternative.

5.3.1.4 MSAT Analysis

The EPA's FMVECP is expected to reduce MSAT emissions by 54 percent in the project area between 2012 and 2030. In addition, VMT in the project area in the UPRR Rail Alternative would be slightly lower than the No Build Alternative VMT, by about 0.02 percent, due to passenger diversions. When taken together, this would result in MSAT emissions with the UPRR Rail Alternative being lower than under the No Build Alternative. Therefore, no adverse air quality impacts from MSAT emissions are anticipated due to this alternative.

5.3.2 Construction Impacts and Mitigations – Union Pacific Railroad Rail Alternative

Construction activities for all of the UPRR Rail Alternative options would be grouped by type of work and location. Overall schedule and coordination would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street Yard and Shop, and to maintain vehicular traffic on affected expressways and roadways. Special or temporary track work might be required between the 95th Street Terminal and the 98th Street Yard and Shop. Because construction would occur in the middle of the expressway, road closures and traffic diversions would occur. The corridor is divided into seven segments for the purposes of describing construction activities; construction for individual segments or groups of adjacent segments could be sequenced to coordinate with CTA operations at the 95th Street Terminal. See Section 5.2.2 for a discussion of emissions, construction sequencing, traffic management, dust control, and construction truck access that would also apply to the UPRR Rail Alternative.

Compared with the other two build alternatives, construction activities for the UPRR Rail Alternative would be the most extensive of any of the three build alternatives being analyzed. However, with the use of appropriate mitigation measures as described above, no violations of any of the IAAQS or NAAQS are anticipated due to this alternative. Therefore, with appropriate mitigation measures in place, no adverse air quality impacts due to construction activities are anticipated due to this alternative.

5.3.3 Cumulative Impacts and Mitigations – Union Pacific Railroad Rail Alternative

The only project that might be related to the UPRR Rail Alternative with respect to air quality impacts is CTA's RPM Project. Without improvements to the existing Red Line, the RLE might not be able to achieve its full potential. The impact on air quality with or without the RPM Project would not be adverse.

5.4 Halsted Rail Alternative

The Halsted Rail Alternative would include a 5-mile extension of the existing Red Line. It would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. It would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. Four stations would be at 103rd Street, 111th Street, 119th Street, and Vermont Avenue.

The air quality analysis presented here applies to the project area as a whole. Because nearly all of the project-related air pollutant emissions would come from motor vehicles and because the project-related motor vehicles would move throughout the entire project area, the air quality analysis applies equally to each part of the Halsted Rail Alternative. In addition, the air pollutant emissions associated with the 119th Street yard and shop would be quite unsubstantial. Therefore, the Halsted Rail Alternative is discussed here in its entirety, rather than by segment or feature.

5.4.1 Permanent Impacts and Mitigations – Halsted Rail Alternative

The Red Line trains run on electricity; therefore, they cause no direct emissions. Their electricity comes from the electric utility grid, which may include local, fossil-fueled power plants. An increase in indirect emissions due to electrical power consumption by the Red Line trains would be expected under the Halsted Rail Alternative.

5.4.1.1 CO Hot Spot Analysis

A summary of the modeled maximum 1-hour CO concentrations at each of the street intersections selected for analysis (98th Place and Halsted Street, 127th Street and Halsted Street, and 127th Street and Wallace Street and Vermont Avenue) is presented in Table 5-1. A summary of the modeled maximum 8-hour CO concentrations for the selected intersections is also presented in Table 5-2.

As shown in Table 5-1, the maximum modeled 1-hour CO concentration at any of the three intersections analyzed for the Halsted Rail Alternative was estimated to be 5.1 ppm, including a background concentration of 3.0 ppm, and occurred at the intersection of 98th Place and Halsted Street. This maximum 1-hour CO concentration occurred at a receptor located along the eastbound departure of 98th Place about 3 meters from the intersection with Halsted Street. All of the modeled 1-hour CO concentrations for the Halsted Rail Alternative were well below the 1-hour CO National and Illinois standards of 35 ppm.

As also shown in Table 5-2, the maximum 8-hour CO concentration for the Halsted Rail Alternative occurred at the same receptor at the same intersection as for the 1-hour concentration and was estimated to be 3.2 ppm, including a background CO concentration of 1.7 ppm. All of the modeled 8-hour CO concentrations for the Halsted Rail Alternative were also well below the corresponding 8-hour CO National and Illinois standards of 9 ppm.

Based on the above analysis, no mitigation measures would be required for any of the traffic intersections analyzed for the Halsted Rail Alternative. Also, no adverse air quality impacts from CO emissions are expected to occur with this alternative.

5.4.1.2 Greenhouse Gas Analysis

This quantitative assessment of project-related GHG benefits and/or impacts on climate change presented here was conducted based on the methods described in Section 3.4.3. The Halsted Rail Alternative is expected to cause a small change in ridership to divert from motor vehicles to trains leading to a small decrease in VMT of 51,427. Thus, this decrease in VMT would lead to a slightly lower amount of GHG emissions under the Halsted Rail Alternative compared to the No Build Alternative.

As shown in Table 5-3, the Halsted Rail Alternative project-related GHG emissions would be about 62,528,056 tpy of CO_2, about 1,979 tpy of CH4, and about 3,036 tpy of N_2O. These results would be an increase of over 16 percent for each pollutant when compared to the existing conditions GHG emissions. When compared to the No Build Alternative GHG emissions, GHG emissions for the Halsted Rail Alternative would be 0.02 percent lower.

When converted to total CO_2e using the GWP conversion factors, the total emissions of GHGs for the Halsted Rail Alternative would be 63,510,713 tpy of CO_2 equivalents. Total project-related CO_2e emissions for the Halsted Rail Alternative would be about 18 percent higher than the 53,894,714 tpy of total project-related CO_2e emissions for the existing conditions. However, compared to the No Build Alternative, the CO_2e emissions for the Halsted Rail Alternative would be lower by about 0.02 percent. Therefore, no adverse air quality impacts from GHG emissions are anticipated due to this alternative.

5.4.1.3 $PM_{2.5}$ Hot Spot Analysis

The $PM_{2.5}$ emissions factors for motor vehicles in the Chicago area are expected to decline by over 38 percent between 2012 and 2030. In addition, VMT in the project area in the Halsted Rail Alternative would be slightly lower than the No Build Alternative VMT, by about 0.02 percent, due to passenger diversions. When taken together, these two parameters would result in a small reduction in existing regional $PM_{2.5}$ emissions with the Halsted Rail Alternative. In addition to the federal exhaust emissions control programs and fuel reformulation programs, statewide efforts to reduce congestion and vehicle idling are also expected to have a direct benefit by reducing $PM_{2.5}$ concentrations at the local level.

In its conformity analysis, CMAP concluded that the *GO TO 2040* plan and the TIP meet all applicable requirements for conformity for the annual $PM_{2.5}$ standard; *GO TO 2040* and the TIP have also been recommended for approval by USDOT. Therefore, no adverse air quality impacts from $PM_{2.5}$ emissions are anticipated due to this alternative.

5.4.1.4 MSAT Analysis

The EPA's FMVECP is expected to reduce MSAT emissions by 54 percent in the project area between 2012 and 2030. In addition, VMT in the project area in the Halsted Rail Alternative would be slightly lower than the No Build Alternative VMT, by about 0.02, percent due to passenger diversions. When taken together, these results would result in regional MSAT emissions with the Halsted Rail Alternative being lower than the No Build Alternative. Therefore, no adverse air quality impacts from MSAT emissions are anticipated due to this alternative.

5.4.2 Construction Impacts and Mitigations – Halsted Rail Alternative

Construction activities for the Halsted Rail Alternatives would be grouped by type of work and location. Overall schedule and coordination of all construction segments would be phased and scheduled to maintain CTA operations at the 95th Street Terminal and 98th Street Yard and Shop, and vehicular traffic on affected expressways and roadways. Special or temporary track work might be required between the 95th Street Terminal and the 98th Street Yard and Shop. Because construction would occur in the middle of the expressway, road closures and traffic diversions would occur. The corridor is divided into five segments for the purposes of describing construction activities; construction for individual segments or groups of adjacent segments could be sequenced to coordinate with CTA operations at the 95th Street Terminal. See Section 5.2.2 for a discussion of emissions, construction sequencing, traffic management, dust control, and construction truck access that would also apply to the UPRR Rail Alternative.

Compared with the other two build alternatives, construction activities for the Halsted Rail Alternative would be less than the UPRR Rail Alternative and somewhat more than the BRT Alternative. However, with the use of appropriate mitigation measures as described above, no violations of any of the IAAQS or NAAQS are anticipated due to this alternative. Therefore, with appropriate mitigation measures in place, no adverse air quality impacts due to construction activities are anticipated due to this alternative.

5.4.3 Cumulative Impacts and Mitigations – Halsted Rail Alternative

The only project that might be related to the Halsted Rail Alternative with respect to air quality impacts is CTA's RPM Project. Without improvements to the existing Red Line, the RLE might not be able to achieve its full potential. The impact on air quality with or without the RPM Project would not be adverse. However, the basis for the regional plan and the TIP would have changed, possibly triggering a need to update the SIP.

Section 6
Impacts Remaining After Mitigation

Based on the results of the air quality analysis presented here, all build alternatives of the RLE Project would provide a regional net air quality benefit when compared to existing conditions or the No Build Alternative.

6.1 Bus Rapid Transit Alternative

With the BRT Alternative, no adverse air quality impacts were identified in any the air quality analyses performed for this alternative. The CO hot spot analysis demonstrated compliance with the IAAQS and NAAQS for CO; the GHG analysis showed fewer GHG emissions compared to the No Build Alternative; the $PM_{2.5}$ assessment demonstrated that lower $PM_{2.5}$ emissions are likely compared to the No Build Alternative; and the assessment of MSAT also demonstrated that lower emissions of MSAT are likely compared to the No Build Alternative.

6.2 Union Pacific Railroad Rail Alternative

As described previously, the air quality analysis presented here applies equally to all of the UPRR Rail Alternative options, as well as to the 120th Street yard and shop. With the UPRR Rail Alternative, no adverse air quality impacts were identified in any the air quality analyses performed for this alternative. The CO hot spot analysis demonstrated compliance with the IAAQS and NAAQS for CO; the GHG analysis showed lower GHG emissions compared to the No Build Alternative; the $PM_{2.5}$ assessment demonstrated that lower $PM_{2.5}$ emissions than with the No Build Alternative would be likely; and the assessment of MSAT also demonstrated that lower emissions of MSAT than with the No Build Alternative would be likely.

6.3 Halsted Rail Alternative

No adverse air quality impacts were identified for the Halsted Rail Alternative. The CO hot spot analysis demonstrated compliance with the IAAQS and NAAQS for CO; the GHG analysis showed lower GHG emissions compared to the No Build Alternative; the $PM_{2.5}$ assessment demonstrated that lower $PM_{2.5}$ emissions than with the No Build Alternative would be likely; and the assessment of MSAT also demonstrated that lower emissions of MSAT than with the No Build Alternative would be likely.

Based on the results of the air quality analysis presented here, all build alternatives of the RLE Project would provide a regional net air quality benefit when compared to existing conditions or the No Build Alternative.

Appendix A
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative–the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on biological resources, including threatened and endangered species and their habitats, vegetation, and other wildlife habitats.

The purpose of the vegetation and wildlife habitat investigation is to describe the existing biological resources (plants, animals, and fish) in the RLE Project vicinity and to evaluate potential impacts on vegetation and wildlife habitats. The area of potential impact (API) for the biological resources evaluation included an area ¼ mile on either side of the alternative centerlines; the API is different for each alternative and each alternative option. Vegetation that provides wildlife habitat occurs in portions of the API around each proposed alternative alignment, stations, and maintenance yards. Local regulations protect some trees and the investigation evaluated the potential impacts on trees as well as on wildlife habitats.

The purpose of the threatened and endangered species investigation is to describe threatened and endangered species that may occur in the project area and the existing habitat conditions including any designated critical habitats. The analysis evaluated potential impacts on species and the habitats of species listed as threatened or endangered by either the federal government or the State of Illinois. Threatened and endangered species or their habitats are found in some portions of the API around each proposed alternative alignment and around stations and maintenance yards. The species most likely to be present is the peregrine falcon and it may be found throughout all of the alternatives' APIs.

The Bus Rapid Transit (BRT) Alternative, Union Pacific Railroad (UPRR) Rail Alternative, and Halsted Rail Alternative each have the potential to require the removal of trees within the API. Most of the trees potentially affected under the BRT Alternative occur at the park & ride facility locations; trees along the UPRR Rail Alternative alignment occur in a narrow band immediately adjacent to the proposed rail line, in the vicinity of the proposed 120th Street yard and shop, and at properties along the corridor. The trees along the Halsted Rail Alternative alignment occur primarily in the median and the sidewalks of Halsted Street. These narrow bands of trees have a lower value to wildlife than blocks of habitat and thus reduce the potential for street tree removal to affect wildlife. Tree removal in any part of the API might affect birds protected under the Migratory Bird Treaty Act (MBTA) and, depending on what part of the API the trees are in, tree removal might also be regulated by local ordinances.

Tree removal has the potential to adversely affect vegetation and wildlife; however, with implementation of mitigation measures, potential impacts on vegetation and wildlife would be less than adverse. Operation of the Red Line following construction of any of the alternatives would have no measurable impact on vegetation and wildlife habitat.

There is a combined total of 114 federal- and state-listed species that potentially occur in Cook County. Listed species with a potential to occur within the API include one bird species (peregrine falcon) and two plant species (hairy white violet and spotted coral-root orchid). There are no known nesting pairs of peregrine falcons within the API, and none of the alternatives would adversely affect foraging habitat. A field visit in August 2012 confirmed no potential habitat for the two plant species.

The conclusion of this investigation is that none of the alternatives would have adverse impacts on listed animal and plant species and no mitigation measures for listed species would be required. Operation of the Red Line following construction of any of the alternatives would have no measurable impacts on listed species.

Development of the BRT Alternative, UPRR Rail Alternative, or Halsted Rail Alternative in combination with related renovation, new construction, and transportation projects identified in the vicinity of the proposed project would not contribute to substantial cumulative impacts on listed species.

The remainder of this memorandum discusses the methods used in the evaluation (Section 3), the affected environment (Section 4), potential impacts and mitigation measures (Section 5), and impacts (none anticipated) that may remain after mitigation (Section 6).

Updated July 27, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix C of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix C supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010–2015 Transportation Improvement Program and the improvements to 95th Street Terminal. The Transportation Improvement Program projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

This technical memorandum on biological resources includes consideration of threatened and endangered species, vegetation, and wildlife habitats.

3.1 Regulatory Framework

3.1.1 Federal

3.1.1.1 National Environmental Policy Act

The National Environmental Policy Act (NEPA) requires a discussion of environmental impacts of a proposal and of a reasonable range of alternatives including the No Build Alternative (40 Code of Federal Regulations [CFR] 1502.1). NEPA does not specify federal thresholds of significance for impacts on vegetation, wildlife habitats, and threatened and endangered species. However, NEPA requires considerations of both context and intensity in determining the significance of potential impacts on a resource. Context means that the significance of an action must be analyzed in the context of the affected region and the locality and not just from a federal perspective. Intensity means that the analysis must consider unique characteristics of the geographic area, such as proximity to ecologically critical areas and whether the action threatens a violation of federal, state, or local laws or requirements imposed for the protection of the environment (40 CFR 1508.27).

In addition, federal courts look to resource agencies such as the Illinois Department of Natural Resources (IDNR) as the public sector subject matter experts, and failure on the part of the lead agency to adequately respond to their comments or address their concerns can present problems during litigation. A NEPA document that does not adequately address the requirements of applicable state laws may be viewed as not legally sufficient (American Association of State Highway and Transportation Officials 2006).

Section 1502.25 of the NEPA regulations further requires that draft EISs be prepared concurrently and integrated with environmental analyses and related surveys and studies required by other federal statutes, including the Endangered Species Act (ESA, 16 United States Code [USC] 1531 et seq.), the MBTA, and others (40 CFR 1502.25).

3.1.1.2 Endangered Species Act

The ESA and subsequent amendments provide for the conservation of threatened and endangered species and the ecosystems upon which they depend. Threatened species are those that are likely to become endangered within all or most of their range in the near future. Endangered species are species that are present in such low numbers that they are in danger of becoming extinct. Section 7 of the ESA requires federal agencies to aid in the conservation of listed species, and to ensure that the activities of federal agencies will not jeopardize the continued existence of listed species or adversely modify designated critical habitat. Critical habitat includes those areas determined to be essential to conservation of a listed species. At the federal level, the United States Fish and

Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS) are responsible for administration of the ESA.

Section 7 of the ESA requires that all federal agencies consult with the Secretary of the Interior on any prospective agency action if an endangered species or a threatened species may be present in the area affected by the project and if implementation of such action will likely affect such species (16 USC 1531). As part of that consultation, the agency must determine whether any species that is listed or proposed to be listed may be present in the area of the proposed action (Section 7(c)). If any such species may be present, then the agency shall conduct a biological assessment for the purpose of identifying any endangered species or threatened species that are likely to be affected by the proposed action. Such assessment may be undertaken as part of a federal agency's compliance with the requirements of Section 102 of NEPA (42 USC 4332).

The ESA makes it unlawful for a person to take a listed animal without a permit. Take is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in any such conduct." The USFWS regulations define harass as "to intentionally or negligently, through act or omission, create the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavior patterns such as breeding, feeding, and sheltering." The threshold for an impact under the ESA is, therefore, very low. For example, any action that could cause an individual of a listed species to alter a breeding location (such as nesting in a different spot due to vegetation clearing) or alter feeding behavior, even for a short period of time (such as foraging in a different portion of an open space area due to construction noise), would be considered harassment.

Under the ESA, federal agencies must also determine whether a proposed project is likely to jeopardize the continued existence of listed species or adversely modify designated critical habitat. For the purpose of this EIS, an adverse impact would be one that would be likely to result in a take of a listed species, and/or jeopardize the continued existence of any endangered or threatened species, and/or destroy or adversely modify designated critical habitat.

There are at least seven federal-listed species in Cook County; none of these species is under the jurisdiction of NMFS. The ESA effects determinations for each listed species are provided in this technical memorandum where it is possible to make such a determination. If there may be an impact (either beneficial or adverse) on a listed species, then Federal Transit Administration (FTA) would initiate coordination with USFWS under Section 7 of the ESA to determine whether the project would jeopardize the continued existence of the species and to identify appropriate conservation measures to limit a take (50 CFR 402). This consultation process would occur during the preparation of a Final EIS. USFWS may develop conservation measures during the consultation process to offset potential impacts on federal-listed species. These conservation measures may be based on the mitigation measures developed through the NEPA process, as appropriate. An incidental take permit may also be issued through that process.

3.1.1.3 Migratory Bird Treaty Act

The MBTA decrees that all migratory birds and their parts (including eggs, nests, and feathers) are fully protected. Nearly all native North American bird species are protected by the MBTA. Under the MBTA, taking, killing, or possessing migratory birds is unlawful. Projects that are likely to result in taking of birds protected under the MBTA require the issuance of take permits from the USFWS. Activities that would require such a permit include destruction of migratory bird nesting habitat during the nesting season when eggs or young are likely to be present. Under the MBTA, surveys are required to determine whether nests would be disturbed and, if so, a buffer area with a specified radius around the nest would be established so that no disturbance or intrusion would be allowed until the young had fledged and left the nest. The size of the buffer area would vary depending on species and local conditions (e.g., presence of busy roads), and would be based on the professional judgment of a monitoring biologist.

3.1.1.4 Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act requires consultation with USFWS and IDNR where the "waters of any stream or other body of water are proposed or authorized, permitted or licensed to be … modified" by any agency under a federal permit or license. Consultation is to be undertaken for the purpose of preventing loss of and damage to wildlife resources (16 USC 662). The Fish and Wildlife Coordination Act applies to all fish and wildlife resources that may be present in the project area, if there are stream or wetland impacts.

3.1.1.5 Bald and Golden Eagle Protection Act

Bald eagles, delisted in 2007, are primarily protected under the Bald and Golden Eagle Protection Act (BGEPA). Administered by the USFWS, this law provides for the protection of the bald eagle (*Haliaeetus leucocephalus*) and the golden eagle (*Aquila chrysaetos*) by prohibiting, except under certain specified conditions, the taking, possession, and commerce of such birds. The BGEPA prohibits unregulated take and makes it illegal to kill, wound, pursue, shoot, shoot at, poison, capture, trap, collect, molest, or disturb bald or golden eagles. If disturbance will occur in potential violation of the act, a permit to authorize take of eagles is required. This permit authorizes incidental take of bald and golden eagles, as well as bald eagle incidental take that complies with the terms and conditions of a previously granted Section 7 incidental take statement. Projects permitted under the BGEPA do not need a permit under the MBTA. Both bald and golden eagles occur in Illinois and would be found primarily along rivers and lakeshore areas with suitable habitat.

3.1.2 State

3.1.2.1 Illinois Endangered Species Act

The IDNR is responsible for administration of the Illinois Endangered Species Act (IESA, 520 Illinois Compiled Statutes [ILCS] 10). Like the federal ESA, the IESA contains procedures for consultation between the project proponent (in this case CTA) and IDNR. The agency proposing an action would prepare a Detailed Action Report to assist the consultation process with IDNR. In cases where there may be an adverse impact on listed species, IDNR will provide recommended mitigation measures to avoid those impacts (Illinois Administrative Code Part 1075). There are approximately 114 species listed by the State of Illinois in Cook County (IDNR 2011).

3.1.2.2 Illinois Compiled Statutes

The IDNR has the authority to manage and regulate all fish and wildlife of the state. The 520 ILCS 5 Wildlife Code states that "the ownership of and title to all wild birds and wild mammals within the jurisdiction of the State are hereby declared to be in the State, and no wild birds or wild mammals shall be taken or killed, in any manner or at any time" without authorization of IDNR (520 ILCS 5/2.1). The 515 ILCS Fish and Aquatic Life Code provides similar authority over all fish and aquatic life, including reptiles and amphibians.

3.1.3 Local

The City of Chicago and the Village of Calumet Park do not have specific policies or regulations related to threatened or endangered species. In addition, the Village of Calumet Park does not have specific regulations related to vegetation or wildlife habitats.

3.1.3.1 City of Chicago

Administered by the Chicago Bureau of Forestry in the Department of Streets and Sanitation, the Chicago Landscape Ordinance prohibits the removal of landscape trees without a permit (Chicago No Date). This ordinance specifies tree replacement standards and protection measures to be employed during construction. No person other than the deputy commissioner shall plant, remove, trim, spray or chemically inject or treat, or in any way affect the general health or structure of a parkway tree or shrub (vegetation planted along streets) without first having obtained a permit to do so (Municipal Code of Chicago 10-32-060). There is no minimum size tree that is exempt from this regulation. The landscape ordinance requires the planting of trees along streets (parkway trees), parking lots, and principal buildings (principal buildings are undefined in the Municipal Code of Chicago). The ordinance does not require parkway trees to be installed or maintained when below or within 50 feet of an elevated rail line (Municipal Code of Chicago 17-11-0103-B).

Chicago's *Urban Forest Agenda* recognizes the value of urban forests to the city and sets a goal of increasing the urban forest canopy from 17 percent (the 2008 level) to 20 percent by 2020 (Chicago 2009). From 1991 through 2007 over 112,000 trees were planted within the City (Chicago 2009).

In February 2006, Chicago adopted the *Chicago Nature and Wildlife Plan*, a strategy to enhance the health and diversity of wildlife within the city. Developed by the Chicago Department of Planning and Development and the Mayor's Nature and Wildlife Committee with support from over 30 conservation organizations, this Plan, which was updated in 2011, is now part of the City of Chicago's formal planning and development initiatives. The Boards of Commissioners of the Chicago Park District and the Forest Preserve District of Cook County have also directed their staffs to work closely towards achieving the objectives of the *Chicago Nature and Wildlife Plan* (Chicago 2006b).

The southern edge of the project area is near the Calumet Industrial Corridor, which is governed by a special set of landscaping requirements that differ slightly from the standard City of Chicago requirements (Chicago Municipal Code 10-32-17-11-0401) (Chicago 2004). The Calumet Industrial Corridor is set within the Calumet Open Space Reserve and the landscaping requirements are intended to reflect the integration of the area with significant areas of natural wildlife habitats. While these regulations may not apply directly to the proposed project, a potential station at 130th Street may be required to conform to the standards that apply to projects immediately west of I-94. These requirements emphasize more naturalistic design standards, such as planting landscaping trees in clusters and the use of native plant species.

The project area is also very close to portions of the Calumet Open Space Reserve, which is governed by the adopted *Calumet Open Space Reserve Plan* (Chicago 2005a). This plan identifies 4,877 acres of open space and natural habitats that are protected or are planned to be protected in the Lake Calumet area.

3.2 Impact Analysis Thresholds

The NEPA regulations do not specify federal thresholds of significance for impacts on threatened and endangered species, vegetation, or wildlife habitats. However, Section 1502.25 of NEPA requires that draft EISs be prepared concurrently and integrated with environmental analyses and related surveys and studies required by other federal statutes including the ESA (16 USC 1531 et seq.) (40 CFR 1502.25). Therefore, for the purpose of this EIS, an impact on a threatened or endangered species would be adverse if it would

- Result in a take of a listed species,
- Jeopardize the continued existence of any listed species, or
- Destroy or adversely modify designated critical habitat.

With respect to impacts on vegetation and wildlife habitats, the significance of potential impacts may also be related to the degree to which a proposal is consistent with federal, state, and local regulations and policies. Potential impacts on vegetation and wildlife habitat are evaluated qualitatively based on whether each alternative would result in the following:

- An adverse impact, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species by USFWS or IDNR.
- An adverse impact on any riparian, wetland, or aquatic habitat or other sensitive natural community.
- Substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impedance of the use of native wildlife nursery sites.

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

- Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan.

Potential adverse impacts are further evaluated based on their location and potential duration and intensity.

3.3 Area of Potential Impact

For potential impacts on threatened and endangered species, designated critical habitats, vegetation, and other wildlife habitats an area within ¼ mile of the proposed alignments, stations, park & ride lots, and maintenance yards for each of the project alternatives was evaluated. The selection of a ¼-mile radius as the API represents a conservative approach for evaluating potential impacts on biological resources from changes to existing habitats and the introduction of noise, light, and construction impacts. The ¼-mile radius is intended to identify sensitive wildlife species and their habitats that may be subject to impacts that may travel larger distances (e.g., light and noise). Given that the project is in a highly urbanized environment with high existing levels of noise, light, and human activity, the impacts of construction and operation on available habitats and associated wildlife would not be expected to extend beyond ¼ mile. Because the potential alignments differ among alternatives, the API also varies. Identified construction areas (including staging areas) were included in the API.

Under ESA an "action area" would be identified that corresponds to the API for the NEPA preferred alternative specified in the Final EIS. If there would be an impact on a listed species, then FTA would consult with USFWS about proposed activities within the action area. The action area would be described in the Final EIS. Under IESA, if there would be an adverse impact on a state-listed species, FTA and CTA would consult with IDNR to develop a conservation plan and measures to minimize and/or mitigate adverse impacts on listed species.

3.4 Methods

The purpose of this biological resources investigation is to describe the existing resources in the RLE Project vicinity and to evaluate potential impacts on listed species and their habitats. Biological resources, including listed species, vegetation, and wildlife habitats within the project area, would be protected by federal, state, and local laws and policies, depending on the specific resources, their location, and applicable federal, state, or local laws. Resources within ¼ mile of each proposed alternative alignment, stations, and maintenance yards were evaluated.

Objectives of this study included the following:

- Identify any federal- or state-listed species reported to potentially occur within the project area and other important biological resources.

- Describe potential threatened and endangered species habitats, fish and wildlife habitat conditions, and plant communities that may be affected by the project.
- Describe potential impacts on biological resources that may result from the project alternatives, including short-term construction impacts, long-term operational impacts, and cumulative impacts.
- Propose mitigation measures to avoid, minimize, and compensate for any adverse impacts.

The methods used to evaluate potential impacts on biological resources included several steps:

- A review of existing data sources.
- Reconnaissance-level field review to establish the presence and existing condition of resources within the project area.
- An evaluation of the potential impacts of construction and operation of each alternative on any of the identified resources.
- Development of proposed mitigation measures for identified impacts, as appropriate.

Each step is described below.

3.4.1 Review Existing Data

The Illinois Ecological Compliance Assessment Tool (EcoCAT) and IDNR lists of species of concern within Cook County were reviewed to identify listed plants and animals with the potential to occur in the project area (IDNR 2012). The USFWS database for species likely to occur in Cook County was also consulted (USFWS 2012). This step included the identification and description of habitat requirements of each listed species that has the potential to occur in Cook County.

Habitats that are potentially present in the project area were identified through existing data sources such as the USFWS National Wetlands Inventory (NWI), the updated NWI mapping created by Ducks Unlimited under contract with the USFWS, the most current available aerial photography, and other data sources that were available from entities such as the City of Chicago.

Habitat areas with the potential to support listed species or other important biological resources were highlighted for field verification in a subsequent step. Wetlands and riparian areas (habitats along the banks of a water course that provide both water and land resources) are important habitat features.

3.4.2 Field Review

Reconnaissance level field verification of identified habitat areas was conducted to confirm the existing condition of each area. Field reviews were conducted on May 15, 16, and 17, 2012; August 13, 2012; and October 15, 2012. The field review included parks and other public open spaces within

¼ mile of either side of the proposed alignments and within ¼ mile of proposed construction staging areas, stations, park & ride lots, and maintenance yards. Undeveloped areas that appear to provide habitat were also investigated to assess their condition and value for wildlife.

Any area of potential habitat for listed species within the API was field verified. The field review consisted of visual observation and photographic documentation of all parks and open space areas. These areas were assessed for their potential to support listed species and/or migratory birds during the breeding season. The condition of each area was noted, including factors such as understory vegetation and levels of human activity that may affect the suitability of each area for use by wildlife.

The existing conditions were used to describe the environmental baseline under the ESA. The environmental baseline represents a basal set of conditions to which the impacts of the proposed action were added. The environmental baseline conditions are specific for each species.

3.4.3 Impact Analysis Methods

The results of the field review were used to determine whether listed species, vegetation and wildlife habitats, including sensitive ecological areas, wetlands, wildlife migratory corridors, and/or habitat conservation areas, occur within the project area. With respect to listed species, the impact evaluation included an assessment of the potential for listed species to be present in the project area, an assessment of existing habitat conditions, the potential impacts of construction and operation of each alternative, and the importance of the existing environment with respect to maintaining each listed species. With respect to vegetation and other wildlife habitats, the impact evaluation included an assessment of whether the project could potentially have direct or indirect impacts, through impacts on individuals or their habitat. If there would be a potential for either direct or indirect impacts, mitigation measures would be required to address those impacts.

3.4.3.1 Threatened and Endangered Species Effects Determination

The USFWS and IDNR identify which listed species occur in Cook County. Those species do not occur uniformly throughout the County and may not occur within the project area. During the field reconnaissance, a qualified biologist determined whether suitable habitat is present for many species. If suitable habitat is not present, the species would not occur within the project area and there would be "*no effect*" on that species from proposed activities within the project area. For those species for which there may be suitable habitat present and which are likely to be present, an effects determination is made based on the following criteria:

- The relevance of the environmental baseline to the species' current status.
- Whether the proposed action would restore, maintain, or degrade the existing baseline conditions.
- The potential impacts of the proposed alternatives on each listed species.

- A determination of whether the species could be expected to survive with an adequate potential for recovery given the impacts of the project, the environmental baseline and any cumulative impacts, and considering measures for survival and recovery specific to all life stages.

If the project could have impacts on threatened or endangered species, by affecting either individuals or habitat, there would be a potential for adverse impacts. If federal-listed species could be affected, FTA would coordinate with USFWS to develop conservation measures to address those impacts. For state-listed species, IDNR would be consulted and mitigation measures would be developed.

If either the Record of Decision or construction occurs more than two years after the consultation on impacts on listed species, then the conclusions of this impact analysis would be reviewed to confirm the results are still valid. This review would include confirmation that the list of species potentially affected has not changed and that there has not been a significant change in the existing condition that would affect the impact analysis conclusions. If the impact analysis review shows that there would be an impact on a new listed species or on one that was not previously affected, then the consultation would need to be re-initiated.

3.4.3.2 Vegetation and Wildlife Habitats Impact Analysis

The results of the field review were used to determine whether valuable vegetation and wildlife habitats occur within the project area. For the build alternatives, the evaluation of potential impacts on vegetation included potential disturbance of protected vegetation, including street trees. Street trees were counted and are tabulated in Section 4. The evaluation of potential impacts on wildlife habitat included a review of areas where mature trees that may provide potential nesting sites for raptors and other birds might be disturbed. These mature trees may be found in parks, cemeteries, and in undeveloped vegetated parcels along the proposed alignments, and around proposed stations, park & ride lots, and maintenance yards. For the analysis of potential impacts on wildlife habitat, these areas were noted as areas of potential habitat and did not include individual tree counts. Removal or disturbance of trees during the nesting season could affect habitat or individuals of special-status species; therefore, an evaluation of these potential impacts for all proposed alternatives was performed.

Areas of potentially sensitive habitats, such as riparian or wetland areas, were identified and assessed for their condition and value for wildlife. Recommendations for avoiding and minimizing impacts on vegetation and wildlife habitats, as well as potential mitigation activities, were developed.

Section 4
Affected Environment

4.1 Vegetation and Wildlife Habitat

Vegetation in the API consists primarily of parkway trees and landscaping around buildings. The API has some remnants of natural vegetation left in small pockets or nature preserves and there may be areas where vegetation has re-established itself following disturbance. Urban wildlife is adapted to this mix of conventional landscaping and remnant patches that comprises the urban vegetative community. When patches of natural vegetation or nature preserves are of a significant size or are connected to other natural areas, a greater diversity of wildlife may be present. Migratory birds may use a wide variety of vegetation types during migration and may be found even in very urbanized landscapes, such as those found in the API. Section 4.2 discusses the listed species identified as potentially occurring within the project area.

In addition to providing wildlife habitat, vegetation in the urban landscape provides a variety of benefits to the human community, including the following:

- Improved air quality
- Reduction of greenhouse gases
- Reduction of the urban heat island effect
- Shade for houses, reducing energy use
- Increased psychological well-being
- Improved aesthetics
- Increased property values
- Stormwater attenuation

In 1837, the City of Chicago incorporated with *Urbs in Horto* (City in a Garden) as its motto (Chicago 2009). Today, Chicago's urban forest comprises over 3.6 million trees, the value of which exceeds $7 million for carbon sequestration and air pollution reduction, not including the carbon storage value of $14.8 million dollars and structural value of $2.3 billion (Chicago 2011). Further value can be seen in the stormwater management, noise abatement, and public health benefits of trees. As described in Section 3.1.3.1, the Chicago Trees Initiative has committed to increasing Chicago's tree canopy (Chicago 2011).

Based on an inventory of city land, the *Chicago Nature and Wildlife Plan* identifies over 4,800 acres of existing prairies, savannas, dunes, woodlands, wetlands, and riparian edges and 920 acres potentially suitable for restoration (Chicago 2006b). That plan identifies the following habitat types:

- Woodland/Forest (1,772 acres in Chicago) - An area with more than 50 percent tree cover.
- Wetland (535 acres in Chicago) - An area saturated with water for a sufficient part of the year that supports emergent reeds, grasses and other aquatic plants.
- Riparian/Water Edge (290 acres in Chicago) - A transitional area between dry and wet environments.
- Beach/Dune (22 acres in Chicago) - A hill or ridge of sand piled by the wind that supports plant life.
- Prairie/Grassland (170 acres in Chicago) - An area dominated by grasses or one possessing less than 10 percent tree cover.
- Savannas (36 acres in Chicago) - An area with 10 to 50 percent tree cover and a native grass and wildflower understory.
- City neighborhoods: Parks, yards, city streets.

The natural habitats of Chicago and its adjacent suburbs support more than 400 species of mammals, birds, reptiles, amphibians, and fish (Chicago 2006b). Of those 400 species, about 300 are birds. Chicago is on the Mississippi Flyway, which is part of a larger bird migration route that extends from the Mackenzie Valley in northwest Canada, along the Great Lakes, and down the Mississippi River Valley. Each year, more than 250 species of migratory birds use this flyway to travel between their winter homes in the southern United States and Central and South America, and their summer homes in North America. With Lake Michigan to the east and farmland to the far west, Chicago's green spaces, especially those with native plants and trees, provide a variety of plant life and habitat for resting and refueling. About 50 species of resident native birds also find a range of suitable habitats in Chicago (Chicago 2006a).

Based on the habitat types described in the *Chicago Nature and Wildlife Plan*, woodland forest and city neighborhoods habitat types are present within the API. "Woodland forest" occurs primarily in the area near the 120th Street yard and shop, but there are also a number of patches along the UPRR Rail Alternative alignment between 107th Street and 111th Street and around Kensington Park. All other portions of the API would be considered "city neighborhoods." Nature areas within the API that are designated in the *Chicago Nature and Wildlife Plan* (Chicago 2006b) are shown in relation to the API on Figure 4-1 and include the following:

- West Pullman Park Savanna - 401 W. 123rd Street, west of Princeton Street between 123rd and 124th Street. This site of an ancient river bluff remnant is host to a grove of over 60 white, red, and black oak and hickory trees (Chicago 2005e).

Figure 4-1: Nature Areas Identified in the *Chicago Nature & Wildlife Plan* within the Areas of Potential Impact

- Riverdale Bend Woods - 12700 S. Stewart Avenue, near 127th Street along the Little Calumet River. This site is part of the Calumet Open Space Reserve (Chicago 2005d).

- Kensington Marsh - 12400 S. Indiana Avenue, north of the Metropolitan Water Reclamation District's Calumet Plant on 130th Street. This marsh was built in 1986 as part of United States Army Corps of Engineers mitigation project, consisting of open water, wetlands, and upland habitat (Chicago 2005c).

- Outside of the project area but just to the east of the UPRR Rail Alternative is Calumet West Shore and Gull Island site, at 11500 Doty Avenue, with over 228 acres of wooded areas, meadows, wetlands, and mud flats on the western shore of Lake Calumet (Chicago 2005b). This site is approximately 0.9 mile to the east of the project, as shown in Figure 4-1.

The IDNR EcoCAT database, which records information based on historical records within the nearest Section/Township/Range, was reviewed. A review of the IDNR EcoCAT database identified the Lake Calumet Illinois Natural Areas Inventory Sites near Lake Calumet west of the UPRR Rail Alternative alignment and the Riverdale Marsh Site beyond the southern end of the Halsted Rail Alternative alignment at the intersection of 138th Street and Halsted Street. The IDNR EcoCAT database recorded occurrences of seven listed species within the sections that encompass the project area, including black-crowned night heron (*Nycticorax nycticorax*), Blanding's turtle (*Emydoidea blandingii*), common moorhen (*Gallinule chloropus*), little blue heron (*Egretta caerulea*), peregrine falcon (*Falco peregrinus*), yellow-crowned night heron (*Nyctanassa violacea*), and yellow-headed blackbird (*Xanthocephalus xanthocephalus*).

These historic records are not necessarily for locations within the API, so even with this more focused data, it is necessary to compare each species' habitat requirements with the existing habitats within the project area. It is also important to understand that this historical data does not provide proof of absence. Results from the IDNR EcoCAT database review are presented in Appendix A.

A review of the NWI information identified wetland areas within the API. See the *Water Resources Technical Memorandum* for more information about wetlands.

Based on inspection of aerial photography, all areas within ¼ mile of the proposed project alignments that appeared to contain approximately ½ acre or more of contiguous habitat cover were identified. In a heavily urbanized area, this area provides a minimum amount of cover where wildlife not generally found in residential yards might be found. During the field investigation, all of these areas were visited and evaluated. With the exception of the forested habitats in the vicinity of the 120th Street yard and shop (approximately 14 acres), none of these areas would support wildlife communities that are significantly different from the surrounding residential and commercial areas.

Trees within the proposed construction footprint of each alternative were counted. Trees may provide nesting and foraging sites for migratory birds and certain trees may be protected by local ordinances. Field surveys were conducted in May and August 2012. An inventory of the number of trees was developed. The City of Chicago landscape ordinance does not apply to trees within 50 feet of a railroad; however, for the purposes of this evaluation, such trees were included as they provide an indicator of the habitat values that might be affected by each alternative.

When applications for local construction permits are filed, it may be necessary to prepare more detailed tree inventories and to update the results of this investigation as some trees would have been removed and others may have been planted.

Tables 4-1, 4-2, and 4-3 show the amount of vegetation or potential wildlife habitat that would be potentially affected by each alternative. The data is shown by vegetation segment. Trees are not evenly distributed along the project corridor, and work in some areas could have greater impacts on vegetation and wildlife than in other segments. In addition, some portions of the UPRR Rail and Halsted Rail Alternative alignments would follow similar routes; therefore, the data is presented by sub-segments to better identify the differences between alternatives.

Portions of the BRT and Halsted Rail Alternative alignments would be within street ROWs and would have the potential to affect street trees; therefore, the data presents the number of trees potentially affected by each alternative. The UPRR Rail Alternative would have the potential to affect blocks of habitat rather than individual street trees; therefore, acres of potentially affected habitat are provided in Table 4-2. As described below, blocks of habitat may provide greater wildlife benefits than street trees, while street trees may be protected by local ordinance.

Figure 4-2 shows the project area including the vegetation segments for which the data in Tables 4-1, 4-2, and 4-3 are presented. The vegetation segments for each alternative are defined as follows:

- BRT Alternative - from the 95th Street Terminal to the 130th Street stop
- UPRR Rail Alternative:
    - Vegetation Segment UA-1: From the 95th Street Terminal to the beginning of the horizontal curve at the UPRR crossing
    - Vegetation Segment UA-2: The horizontal curve at the UPRR crossing
    - Vegetation Segment UA-3: From the end of the horizontal curve at the UPRR crossing to the Canadian National (CN)/Metra Electric crossing
    - Vegetation Segment UB: From the CN/Metra Electric crossing to the beginning of the 130th Street station sites
    - South Station Option
    - West Station Option
    - 120th Street Yard and Shop

- Halsted Rail Alternative:
    - Vegetation Segment HA-1: From the 95th Street Terminal along the I-57 corridor to the beginning of the horizontal curve at the I-57 crossing
    - Vegetation Segment HA-2: The horizontal curve at the I-57 crossing
    - Vegetation Segment HA-3: From the end of the horizontal curve at the I-57 crossing to the 119th Street station
    - Vegetation Segment HB: From the 119th Street station to Vermont Avenue
    - 119th Street Yard and Shop

Figure 4-2: Project Area including Segments

The trees potentially affected by the BRT Alternative (Table 4-1) are in the park & ride sites; some of these trees are parkway trees along streets in sidewalks and some are landscape trees on private lands around buildings.

The trees potentially affected by the UPRR Rail Alternative (Table 4-2) are in backyards and abandoned industrial parcels and along the railroad embankment. West of the UPRR tracks between 108th and 111th Streets, several abandoned industrial parcels have regrown with a mix of native and non-native trees, small trees, and shrubs. These patches of habitat are disconnected from other larger habitat patches, but they have developed several vegetative layers and have a good understory of shrubs, small trees and herbaceous cover. This provides a variety of habitats for urban adapted species. These areas are likely to support a greater variety and number of urban wildlife species than the narrow bands of trees along the railroad embankment further to the south. These areas would be more valuable for wildlife than most street trees or isolated specimen trees in backyards.

Many of the trees along the UPRR Rail Alternative alignment are in narrow bands along the existing rail corridor. Some of the trees included are parkway trees planted along streets in sidewalks and some are landscape trees on private lands around buildings. Narrow rows of trees provide many of the benefits identified by the Chicago Urban Forest Agenda (Chicago 2009). However, they provide fewer wildlife benefits than if the same number of trees were organized into a clump. Due to their mobility, some migratory bird species may utilize these trees during migration. In addition, there is the potential for migratory birds to use existing mature trees within the project area for breeding. The frequent passing of trains and the associated noise and vibration would reduce the value of narrow bands of trees for bird use.

Most of these areas are isolated from other parks or patches of habitat and thus would not be as valuable as might be expected based on the number of trees alone. The forested areas are affected by human disturbances and urban influences, such as traffic and rail noise, trash, and light pollution. The forested areas that are becoming established at the south end of the UPRR Rail Alternative alignment represent the best habitat within the entire API, followed closely by the patches along the West Option between 108th and 111th Streets.

Minimal habitat exists along the Halsted Rail Alternative alignment (Table 4-3); trees are primarily in the median and sidewalks of Halsted Street. The habitat within the proposed maintenance yard for the Halsted Rail Alternative is composed of vegetation that has re-established in several patches following abandonment of previous urban uses. It is not as well developed as similar patches found along the UPRR Rail Alternative West Option alignment.

Large birds such as herons, hawks, and eagles make large nests that persist through the winter months. These birds will return to the same nesting territory year after year and reuse the same nests. Their nests can be very visible in the winter when the leaves are off the trees. No large nests indicating the presence of herons, hawks, or eagles were observed in the API during the May, August, or October 2012 field visits. Eagles perch on tall trees near water or open spaces or on the ground in more open areas. There do not appear to be suitable perching areas for eagles within the API.

During a field visit on October 15, 2012, monk parakeet (*Myiopsitta monachus*) nests were identified in and around a cell phone tower at the northeast corner of 119th Street and Halsted Street. Approximately six nests were identified within the cell phone tower, and green monk parakeets were seen entering and exiting the nests. Photos of the nests are included in Appendix B.

The Cedar Park Cemetery at 12540 South Halsted Street in Calumet Park is home to a small herd of non-native Japanese Sika deer (*Cervus nippon*). The herd has been living in the cemetery since the 1920s and they graze off the land. The deer do not leave the confines of the cemetery. The Cedar Park Cemetery also contains several patches of habitat where there is an understory layer under the mature tree canopy. Areas with an understory layer of shrubs and small trees are more valuable for wildlife than areas that only contain mature trees with maintained grass underneath. These habitat areas are not in areas that would be affected by any of the alternatives.

4.2 Threatened and Endangered Species

There are 114 federal- and state-listed species that potentially occur within Cook County. Listed species include those listed as threatened, endangered, or candidates for listing as threatened or endangered. The entire API is within Cook County. Table 4-4 lists each species, its status (e.g., federally threatened, state endangered), a brief description of its habitat requirements, and an assessment of whether the species has the potential to occur within the API. Each species' habitat requirements were compared against the existing habitats within the API to determine the likelihood that a species could occur within the project area. Only those species that could potentially occur within the project area are considered further. The shaded row in Table 4-4 indicates the species with the potential to occur within the API.

The IDNR EcoCAT database was consulted for information about known occurrences of listed species within the project area. The IDNR EcoCAT database identified seven species within the sections that encompass the project area, as discussed in Section 4.0 (Appendix A). These species are most likely included due to the proximity of the API to the Little Calumet River and natural areas next to the river and do not occur within the API. Other than the peregrine falcon (discussed below), there is no suitable habitat for the other six species in the API.

Table 4-4: Listed Species in Cook County

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Invertebrates			
Slippershell (freshwater mussel) *Alasmidonta viridis*	ST	Creeks and headwaters of rivers in sand or gravel substrates with high gradients or riffles. Occasionally in larger rivers and lakes and in mud substrates.	Unlikely, habitat does not occur in the project area.
Elfin Skimmer (dragonfly) *Nannothemis bella*	ST	Bogs and occasionally in calcareous fens with sedge meadows and marl deposits.	Unlikely, habitat does not occur in the project area.
Eryngium Stem Borer (moth) *Papaipema eryngii*	SE	Mesic and wet-mesic prairie. In Illinois, associated with moderately disturbed to relatively undisturbed prairie.	Unlikely, habitat does not occur in the project area.
Hine's Emerald Dragonfly *Somatochlora hineana*	FE, CH, SE	Spring fed wetlands, wet meadows, and marshes. Project area is not within designated critical habitat.	Unlikely, habitat does not occur in the project area.
Amphibians			
Mudpuppy (salamander) *Necturus maculosus*	ST	Rivers, lakes, and other permanent water sources with hard cover such as rocks, logs, and overhangs. Will also utilize debris, reeds, mud, stream banks, and other areas.	Unlikely, habitat does not occur in the project area.
Reptiles			
Blanding's Turtle *Emydoidea blandingii*	SE	Quiet waters in marshes, prairie wetlands, wet sedge meadows, and shallow, vegetated portions of lakes.	Unlikely, habitat does not occur in the project area.
Kirtland's Snake *Clonophis kirtlandi*	ST	Prairie wetlands, wet meadows, and grassy edges of creeks, ditches, and ponds, usually in association with crayfish burrows. Has been found in damp habitat remnants in vacant lots of urban settings.	Unlikely, habitat does not occur in the project area.
Eastern Massasauga *Sistrurus catenatus catenatus*	FC, SE	Wet areas including wet prairies, marshes, and low areas along rivers and lakes. Also uses adjacent uplands during part of the year. Often hibernates in crayfish burrows but may also be found under logs and tree roots or in small mammal burrows.	Unlikely, habitat does not occur in the project area.

Status Legend

FT - Federal Threatened (listed)
FC - Federal Candidate
CH - Critical habitat has been designated (federal) in Cook County.

State Protected:
SE - State Endangered
ST - State Threatened

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Fish			
Longnose Sucker *Catostomus catostomus*	ST	Cool, spring-fed creeks, lakes and their tributary streams.	Unlikely, habitat does not occur in the project area.
Iowa Darter *Etheostoma exile*	ST	Cool, clear to slightly turbid, slow moving vegetated brooks and weedy portions of glacial lakes, marshes and ponds.	Unlikely, habitat does not occur in the project area.
Banded Killifish *Fundulus diaphanus*	ST	Shallow, clear and quiet water streams, rivers, ponds and lakes with sand, gravel or mud substrates. Often found near submerged aquatic vegetation.	Unlikely, habitat does not occur in the project area.
Blackchin Shiner *Notropis heterodon*	ST	Very clear waters of glacial lakes and marshes with an abundance of submerged aquatic vegetation.	Unlikely, habitat does not occur in the project area.
Birds*			
Least Bittern *Ixobrychus exilis*	ST	Emergent vegetation in freshwater marshes and occasionally saltwater or brackish marshes.	Unlikely, habitat does not occur in the project area.
Snowy Egret *Egretta thula*	SE	Emergent wetlands associated with freshwater marshes and along the periphery of large water bodies.	Unlikely, habitat does not occur in the project area.
Little Blue Heron *Egretta caerulea*	SE	Swamps, estuaries, rivers, ponds, and lakes.	Unlikely, habitat does not occur in the project area.
Black-crowned Night Heron *Nycticorax nycticorax*	SE	Forests, scrub/shrub, marshes, and ponds serve as nesting, roosting, and foraging habitats. Colonies may be located in wooded swamps, coastal dune forests, vegetated dredge spoil islands, scrub thickets, or marshes in close proximity to water. Migratory.	Unlikely, habitat does not occur in the project area.
Yellow-crowned Night Heron *Nyctanassa violacea*	SE	Nest on barrier islands, dredge spoil islands, and bay islands that contain forested wetlands or scrub/shrub thickets. Colonies may be located in dense shrubby thickets, forests with an open understory or suburban parks and yards that offer suitable habitat. Migratory.	Unlikely, habitat does not occur in the project area.
Osprey *Pandion haliaetus*	SE	Nests in all forested vegetation types with large trees near water, as well as on platforms erected in less optimal habitat. Migratory.	Unlikely, habitat does not occur in the project area.

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Peregrine Falcon *Falco peregrinus*	ST	Nests on cliff ledges above or near open water including lakes, ponds, rivers, and seas. Uses a wide variety of foraging habitats, including croplands and riparian areas along rivers, ponds, marshes, and meadows, and open areas where avian prey are vulnerable, including pastures, grasslands, mountain valleys, and gorges. Migratory.	Potential to occur in suitable habitat within the project area.
King Rail *Rallus elegans*	SE	Emergent vegetation in freshwater marshes and brackish tidal marshes.	Unlikely, habitat does not occur in the project area.
Common Moorhen *Gallinula chloropus*	SE	Freshwater and brackish marshes, lakes, canals and ponds with cattails and other aquatic vegetation.	Unlikely, habitat does not occur in the project area.
Piping Plover *Charadrius melodus*	FE	Wide, flat, open, sandy beaches with very little grass or other vegetation. Nesting territories often include small creeks or wetlands.	Unlikely, habitat does not occur in the project area.
Upland Sandpiper *Bartramia longicauda*	SE	Open prairies, grasslands, pastures, wet meadows and hayfields.	Unlikely, habitat does not occur in the project area.
Wilson's Phalarope *Phalaropus tricolor*	SE	Nests in shallow, prairie wetlands. During migration, inhabits shallow ponds, flooded fields, and sometimes mudflats.	Unlikely, habitat does not occur in the project area.
Black Tern *Chlidonias niger*	SE	Nests in emergent vegetation along the shoreline periphery of freshwater lakes, wetlands, and marshes along rivers and ponds. Forages in wet meadows, pastures, agricultural fields, and water.	Unlikely, habitat does not occur in the project area.
Yellow-headed Blackbird *Xanthocephalus xanthocephalus*	SE	Nests in deep-water marshes, sloughs, forested wetlands, and along lake edges. Can sometimes be found in huge flocks in open fields and pastures during migration and in winter.	Unlikely, habitat does not occur in the project area.
Mammals			
Franklin's Ground Squirrel *Spermophilus franklinii*	ST	Tall grass and mid-grass prairies. Also uses riparian areas (marsh edges), forest-field edges, fields, hedgerows, and unmowed strips along railroad rights-of-way and roadsides. Generally avoids short grass habitats. Nests are in underground burrows.	Unlikely, habitat does not occur in the project area.

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Plants			
Shadbush *Amelanchier interior*	ST	Dry woods, bluffs above rivers, rocky areas and slopes, banks of streams, fields, thickets, and sandy areas; less often in wetlands.	Unlikely, habitat does not occur in the project area. Field survey did not detect.
Shadbush Amelanchier sanguinea	SE	Margins of woods, river ledges, shorelines, rocky slopes, crevices of open rock faces and cliffs, non-calcareous to slightly calcareous sites.	Unlikely, habitat does not occur in the project area.
Marram Grass *Ammophila breviligulata*	SE	Drier areas of sandy beaches and unstabilized or partially stabilized sand dunes along coastal areas including the Great Lakes.	Unlikely, habitat does not occur in the project area.
Wooly Milkweed *Asclepias lanuginosa*	SE	Dry, sandy, or gravelly hillside prairies.	Unlikely, habitat does not occur in the project area.
Mead's Milkweed *Asclepias meadii*	FT	Moderately wet (mesic) to moderately dry (dry mesic) upland tallgrass prairie or glade/barren habitat characterized by vegetation adapted for drought and fire. Persists in stable late-successional prairie.	Unlikely, habitat does not occur in the project area.
Oval Milkweed *Asclepias ovalifolia*	SE	Hill prairies and dry sand prairies, typical savannas and sandy savannas, and openings in upland oak woodlands.	Unlikely, habitat does not occur in the project area.
Forked Aster *Aster furcatus*	ST	Glacial moraines, sedge meadows or woodland ponds.	Unlikely, habitat does not occur in the project area.
American Slough Grass *Beckmannia syzigachne*	SE	Marshes, low wet ground or “sloughs,” floodplains, pond shores, lakes, streams, ditches, and other types of open wetland habitats.	Unlikely, habitat does not occur in the project area.
Kittentails *Besseya bullii*	ST	Dry sand prairies, dry gravel prairies, hill prairies, barren savannas, thinly wooded bluffs, and sandy or gravelly riverbanks.	Unlikely, habitat does not occur in the project area.
Northern Grape Fern *Botrychium multifidum*	SE	Old pastures, meadows, woodland margins, riverbanks, and bottomlands in subacid soil.	Unlikely, habitat does not occur in the project area.
Dwarf Grape Fern *Botrychium simplex*	SE	Meadows, barrens, and woods, usually in subacid soil.	Unlikely, habitat does not occur in the project area.
Sea Rocket *Cakile edentula*	ST	Sand shores and low dunes, often found on the ridge of wind-blown sand behind the high-tide line of beaches.	Unlikely, habitat does not occur in the project area.

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Grass Pink Orchid *Calopogon tuberosus*	SE	Moist prairie and acid-soiled boggy areas, typically growing in sphagnum.	Unlikely, habitat does not occur in the project area.
Golden Sedge *Carex aurea*	ST	Moist, open or shaded habitats, especially meadows and seepage slopes, usually on basic soils.	Unlikely, habitat does not occur in the project area.
Sedge *Carex bromoides*	ST	Soggy deciduous woodlands, muddy margins and shallow water of vernal pools in wooded areas, hardwood swamps, typical seeps and gravelly seeps in wooded areas, bogs, edges of marshes, and sedge meadows. Found in higher quality natural areas.	Unlikely, habitat does not occur in the project area.
Sedge *Carex echinata*	SE	Bogs, swamps, peaty or sandy shores of streams or lakes, wet meadows, usually in acidic soils.	Unlikely, habitat does not occur in the project area.
Sedge *Carex formosa*	SE	Mesic to dry deciduous forests and ravines, moist meadows, usually associated with calcareous soils.	Unlikely, habitat does not occur in the project area.
Sedge *Carex garberi*	SE	Moist shores, meadows, fens, on base-rich soils.	Unlikely, habitat does not occur in the project area.
Swollen Sedge *Carex intumescens*	ST	Dry-mesic to wet coniferous, mixed, and deciduous forests, forest openings, thickets, wet meadows, ditches.	Unlikely, habitat does not occur in the project area.
Tuckerman's Sedge *Carex tuckermanii*	SE	Deciduous swamp forests, thickets, often along streams or pond shores, wet meadows.	Unlikely, habitat does not occur in the project area.
Little Green Sedge *Carex viridula*	ST	Sandy to rocky, often marly, open or marshy shores, beach pools, and interdunal swales; often in early successional habitats with bare soil.	Unlikely, habitat does not occur in the project area.
Pretty Sedge *Carex woodii*	ST	Usually dry, calcareous woodlands.	Unlikely, habitat does not occur in the project area.
Leatherleaf *Chamaedaphne calyculata*	ST	Boreal and subarctic peatlands, margins of boggy swamps and streams in coniferous forests, pocosins in coastal plain, often forming dense thickets.	Unlikely, habitat does not occur in the project area.
Seaside Spurge *Chamaesyce polygonifolia*	SE	Sandy beaches and dunes along Lake Michigan.	Unlikely, habitat does not occur in the project area.
Spotted Wintergreen *Chimaphila maculata*	SE	Coniferous, mixed, and deciduous forests, xeric sand communities.	Unlikely, habitat does not occur in the project area.

Status Legend

ST - State Threatened

Cook County, Illinois
Federal- and State-Listed Species

Species	Status	Habitat Requirements	Likelihood of Occurrence
Pitcher's (Dune) Thistle *Cirsium pitcheri*	ST	Beach and dune habitats around lakes Huron, Michigan, and Superior. Was extirpated from portions of its former range at the southern end of Lake Michigan.	Unlikely, habitat does not occur in the project area.
Sweetfern *Comptonia peregrina*	SE	Dry, sterile, sandy to rocky soils in pinelands or pine barrens, clearings, or edges of woodlots.	Unlikely, habitat does not occur in the project area.
Spotted Coral-root Orchid *Corallorhiza maculata*	ST	Habitats vary from deciduous forests and mixed coniferous/deciduous forests to predominantly coniferous forests.	Unlikely, habitat does not occur in the project area. Field survey did not detect.
White Lady's Slipper *Cypripedium candidum*	ST	Mesic to wet prairies and fen meadows, very rarely open wooded slopes.	Unlikely, habitat does not occur in the project area.
Leafy-prairie Clover *Dalea foliosa*	FE, SE	Prairie remnants along the Des Plains River in Illinois, in thin soils over limestone substrate.	Unlikely, habitat does not occur in the project area.
Hairgrass Deschampsia flexuosa	SE	Oak savanna and woodland habitat.	Unlikely, habitat does not occur in the project area.
Northern Panic Grass *Dichanthelium boreale*	SE	Semi-open areas in damp or sandy woodlands, thickets, or on banks.	Unlikely, habitat does not occur in the project area.
Narrow-leaved Sundew *Drosera intermedia*	ST	Constantly moist to wet bogs, fens, and marshes. It prefers nutrient free soils, such as sphagnum peat moss or sandy ground, and open, sunny habitats.	Unlikely, habitat does not occur in the project area.
Round-leaved Sundew *Drosera rotundifolia*	SE	Most often bogs, but also swamps, rotting logs, mossy crevices in rocks, or damp sand along stream, lake, or pond margins.	Unlikely, habitat does not occur in the project area.
Capitate Spikerush *Eleocharis olivacea*	SE	A variety of wet, open situations: shores, pond margins, bog mats, fields; often in deeper water than many other spike-rushes.	Unlikely, habitat does not occur in the project area.
Few-flowered Spikerush *Eleocharis pauciflora*	SE	Damp calcareous shores, ledges and swamps.	Unlikely, habitat does not occur in the project area.
Spike Rush *Eleocharis rostellata*	ST	Very wet calcareous or brackish fens, springs, shores.	Unlikely, habitat does not occur in the project area.
Bearded Wheat Grass *Elymus trachycaulus*	ST	Adapted to a wide range of soils and climates. Grows in very dry to very boggy habitats. In Illinois, found in mesic prairies and wet dolomite outcrops.	Unlikely, habitat does not occur in the project area.

FC - Federal Candidate
CH - Critical habitat has been designated (federal) in Cook County.

State Protected:
SE - State Endangered
ST - State Threatened

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Queen-of-the-prairie *Filipendula rubra*	SE	Fens, calcium-rich peat producing wetlands.	Unlikely, habitat does not occur in the project area.
Northern Cranesbill *Geranium bicknellii*	SE	Woodland openings, sandy Black Oak woodlands, typical and sandy savannas, and rocky outcrops.	Unlikely, habitat does not occur in the project area.
Tall Sunflower *Helianthus giganteus*	SE	Thickets, swamps, and meadows.	Unlikely, habitat does not occur in the project area.
Kalm's St. John's Wort *Hypericum kalmianum*	SE	Moist; dunes, shores; in rocky, sandy soil.	Unlikely, habitat does not occur in the project area.
Richardson's Rush *Juncus alpinus*	SE	Wet, open to semi-open situations; in sandy, usually calcareous soil: shores of lakes and ponds, marshes, ditches, wet meadows, and wet areas of abandoned limestone quarries.	Unlikely, habitat does not occur in the project area.
Ground Juniper *Juniperus communis*	ST	Dry, open, rocky, wooded hillsides, sand terraces, maritime escarpments, and on exposed slopes and plateaus. It is found on dunes or dune heath in coastal areas, on isolated mountains, and may spread into fields and pastures.	Unlikely, habitat does not occur in the project area.
Pale Vetchling *Lathyrus ochroleucus*	ST	Open woods, thickets, and clearings on well drained, usually calcareous substrate.	Unlikely, habitat does not occur in the project area.
Prairie Bush Clover *Lespedeza leptostachya*	FT, SE	Dry to mesic prairies with gravelly soil.	Unlikely, habitat does not occur in the project area.
Blazing Star *Liatris scariosa* var. *nieuwlandii*	ST	Savannas and prairies or at woodland edges or forest openings, primarily on aged glacial till or loess soils.	Unlikely, habitat does not occur in the project area.
Indian Cucumber Root *Medeola virginiana*	SE	Moist slopes, mesic woods.	Unlikely, habitat does not occur in the project area.
Slender Sandwort *Minuartia patula*	ST	Prairies, meadows, limestone barrens, and rocky outcrops in sandy, clayey, or gravelly soils.	Unlikely, habitat does not occur in the project area.
Small Sundrops *Oenothera perennis*	ST	Dry to moist open ground, open woods, fields, and meadows.	Unlikely, habitat does not occur in the project area.

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Heart-leaved Plantain *Plantago cordata*	SE	Wet woods, sloughs, rocky streambeds, springs.	Unlikely, habitat does not occur in the project area.
Orange Fringed Orchid *Platanthera ciliaris*	SE	Moist sandy and peaty meadows, marshes, prairies, pine savannas, open woods, wet wooded flats, seeping slopes, roadsides, dry wooded slopes, sphagnum bogs.	Unlikely, habitat does not occur in the project area.
Wood Orchid *Platanthera clavellata*	SE	Sphagnum bogs, sphagnous seeps and meadows, wet sandy and peaty meadows, marshes, low woods, wet prairies, and roadsides.	Unlikely, habitat does not occur in the project area.
Tubercled Orchid *Platanthera flava* var. *herbiola*	ST	Alluvial forests, riparian thickets, wet meadows, wet prairies, seeps, salt marshes.	Unlikely, habitat does not occur in the project area.
Eastern Prairie Fringed Orchid *Platanthera leucophaea*	FT, SE	Moist to mesic black soil prairies, sand prairies, thickets, pothole marshes, and fens.	Unlikely, habitat does not occur in the project area.
Purple Fringed Orchid *Platanthera psycodes*	SE	Alluvial and swamp forests, stream banks, riparian meadows, moist and seeping slopes, marshes, roadside banks, ditches, old fields.	Unlikely, habitat does not occur in the project area.
Weak Bluegrass *Poa languida*	SE	Along the edges of wetlands on gravelly, well drained, calcareous substrates.	Unlikely, habitat does not occur in the project area.
Snake-mouth *Pogonia ophioglossoides*	SE	Sphagnum bogs, poor fens, moist acidic sandy meadows and prairies, open wet woods, wet pine flatwoods, pine savannas, cypress swamps, sandy-peaty stream banks, seepage slopes, ditches, roadcuts, rarely calcareous fens.	Unlikely, habitat does not occur in the project area.
Downy Solomon's Seal *Polygonatum pubescens*	SE	Rich, moist, wooded slopes and coves.	Unlikely, habitat does not occur in the project area.
Carey's Heartsease *Polygonum careyi*	SE	Moist, open to semi-open areas, often in sandy soil: swamps, thickets, riverbeds, sand prairies, and disturbed areas such as fields, meadows, clearings, recent barns, and cultivated ground.	Unlikely, habitat does not occur in the project area.
Balsam Poplar *Populus balsamifera*	SE	Open, rich, low woods, cool, seasonally wet soils, bog margins in boreal forests, aspen parklands, montane streamsides, rocky slopes, gallery forests within tundra.	Unlikely, habitat does not occur in the project area.
Grass-leaved Pondweed Potamogeton gramineus	ST	Ponds, lakes, streams, and rivers.	Unlikely, habitat does not occur in the project area.

Status Legend

Cook County, Illinois Federal- and State-Listed Species			
Species	Status	Habitat Requirements	Likelihood of Occurrence
Fern Pondweed *Potamogeton robbinsii*	SE	Shallow to deep water of ponds, lakes, and slow-flowing rivers.	Unlikely, habitat does not occur in the project area.
Beaked Rush *Rhynchospora alba*	ST	Acid, sphagnous, boggy, open sites, poor fens, often on floating mats or peaty interstices of rocky shores.	Unlikely, habitat does not occur in the project area.
Purple-flowering Raspberry *Rubus odoratus*	SE	Moist, shady places; woodland edges.	Unlikely, habitat does not occur in the project area.
Dwarf Raspberry *Rubus pubescens*	ST	Rich, moist mixed woodland and boreal forests, bog hummocks, thickets, and stream margins.	Unlikely, habitat does not occur in the project area.
Bristly Blackberry *Rubus schneideri*	ST	Wet, open habitats; often occurs on sand prairies or shrub prairies.	Unlikely, habitat does not occur in the project area.
Bulrush *Scirpus hattorianus*	SE	Moist meadows, marshes, and ditches.	Unlikely, habitat does not occur in the project area.
Royal Catchfly *Silene regia*	SE	Dry, mesic barrens and prairies.	Unlikely, habitat does not occur in the project area.
Mountain Blue-eyed Grass *Sisyrinchium montanum*	SE	Moist, sandy meadows and open woods.	Unlikely, habitat does not occur in the project area.
Green-fruited Burreed *Sparganium emersum*	SE	Still to flowing eutrophic and mesotrophic, circumneutral to somewhat alkaline waters.	Unlikely, habitat does not occur in the project area.
Yellow-lipped Ladies' Tresses *Spiranthes lucida*	SE	Rocky and sandy riverbanks, calcareous seeps, fens.	Unlikely, habitat does not occur in the project area.
Great Chickweed *Stellaria pubera*	SE	Rich deciduous woods, alluvial bottomlands.	Unlikely, habitat does not occur in the project area.
Lakeside Daisy *Tetraneuris herbacea*	SE	Alvars (limestone flats), openings in woods.	Unlikely, habitat does not occur in the project area.
False Asphodel *Tofieldia glutinosa*	ST	Open, calcareous fens and sedge meadows.	Unlikely, habitat does not occur in the project area.
Ear-leafed Foxglove *Tomanthera auriculata*	ST	Disturbed prairies and savannas, thickets containing grasses and occasional shrubs, woodland borders, abandoned fields.	Unlikely, habitat does not occur in the project area.

Status Legend
Federally protected:
FE - Federal Endangered (listed)
FT - Federal Threatened (listed)
FC - Federal Candidate
CH - Critical habitat has been designated (federal) in Cook County.

State Protected:
SE - State Endangered
ST - State Threatened

Cook County, Illinois
Federal- and State-Listed Species

Species	Status	Habitat Requirements	Likelihood of Occurrence
Star-flower *Trientalis borealis*	SE	Moist to wet coniferous forest, open heath lands, mature northern hardwood forests.	Unlikely, habitat does not occur in the project area.
Slender Bog Arrow Grass *Triglochin palustris*	ST	Coastal and mountain marsh areas and moist alkaline meadows.	Unlikely, habitat does not occur in the project area.
Nodding Trillium *Trillium cernuum*	SE	Rich, mostly deciduous forest southward, mixed deciduous-coniferous forests, swamps, moist coniferous forests northward.	Unlikely, habitat does not occur in the project area.
Flat-leaved Bladderwort *Utricularia intermedia*	ST	Shallow ponds, slow-moving streams, and wet sedge or rush meadows.	Unlikely, habitat does not occur in the project area.
Small Bladderwort *Utricularia minor*	SE	Shallow waters or sometimes emergent on the wet margins of pools.	Unlikely, habitat does not occur in the project area.
Large Cranberry *Vaccinium macrocarpon*	SE	Bogs, swamps, mires, wet shores and headlands.	Unlikely, habitat does not occur in the project area.
Small Cranberry *Vaccinium oxycoccos*	SE	Half buried in sphagnum hummocks in bogs, fens, muskeg, arctic-alpine tundra.	Unlikely, habitat does not occur in the project area.
Marsh Speedwell *Veronica scutellata*	ST	Marshes, wet meadows, low areas along springs, low muddy areas along ponds, and swamps.	Unlikely, habitat does not occur in the project area.
Hairy White Violet *Viola blanda*	SE	Dry to very moist woods, thickets, clearings, forested fens and mesic forests on river bluffs.	Unlikely, habitat does not occur in the project area. Field survey did not detect.
Canada Violet *Viola canadensis*	SE	Moist, open, wooded areas.	Unlikely, habitat does not occur in the project area.

Peregrine falcons are large falcons that are specialized for capturing smaller birds in the air. They typically nest on cliff ledges and in urban areas they have been found nesting on ledges of tall buildings and high bridges. The EcoCAT database returned several records for peregrine falcons within the sections/townships/ranges that encompass the project area. There are no known nesting pairs within the API. Tall buildings that would be likely to be attractive to nesting falcons do not appear to occur within the API. Falcons could be expected to forage for small birds and pigeons throughout the project area. They would be found flying high above the project area and perched on buildings and other structures within the project area. Although peregrine falcons are migratory, falcons have been observed in the Chicago area in the winter in recent years. With the exception of the 120th Street yard and shop site, the project area is characterized by dense residential, multifamily, and commercial uses that contain a wide variety of structures and activity levels. There is no part of the API that would be expected to provide unique or particularly rich foraging habitat for peregrine falcons. However, the semi-natural habitats in the vicinity of the 120th Street yard and shop site, and large parks and open spaces (such as large cemeteries) might be expected to provide slightly greater foraging opportunities for falcons. In addition, the API represents a small proportion of a falcon’s foraging territory.

Section 5
Impacts and Mitigations

The BRT Alternative, UPRR Rail Alternative, and Halsted Rail Alternative would all have the potential to adversely affect vegetation and wildlife habitat during construction; however, with the implementation of the proposed mitigation measures, potential impacts would be less than adverse. Operation of the Red Line following construction of any of the alternatives would have no measurable impact on listed species.

Development of the BRT Alternative, UPRR Rail Alternative, or Halsted Rail Alternative in combination with related renovation, new construction, and transportation projects identified in the vicinity of the proposed project would not contribute to substantial cumulative impacts on listed species.

5.1 No Build Alternative

The No Build Alternative represents existing conditions for biological resources in the project area.

5.1.1 Permanent Impacts and Mitigations - No Build Alternative

There would be no permanent impacts anticipated on biological resources as a result of the No Build Alternative.

5.1.2 Construction Impacts and Mitigations - No Build Alternative

There would be no construction impacts anticipated on biological resources as a result of the No Build Alternative.

5.2 Bus Rapid Transit Alternative

The BRT Alternative API has existing bus service, and there would be minimal change in activity levels.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

There would be some loss of vegetation at the 130th Street park & ride lot. However, this area is isolated from other habitats by 130th Street and the Metropolitan Water Reclamation District treatment plant. The area has some trees, but they do not appear to be mature. The area would provide minimal potential for migratory bird use. Therefore, with compliance with local tree protection ordinances, potential impacts would not be adverse. After mitigation, there would be no measurable impacts on biological resources remaining.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

A small number of trees would likely be removed as a result of construction activities under the BRT Alternative. Most of the removal would likely occur at the park & ride facilities.

Local tree protection ordinances address the values that trees provide to the human environment. Removal of trees may have adverse impacts on the human environment as well as wildlife habitat. Compliance with local tree protection ordinances would result in less than adverse impacts on the human environment from tree removal. Additional mitigation measures may be required to reduce potential impacts on wildlife habitat.

During project permitting, a detailed tree inventory would need to be prepared for each work zone. Compliance with local tree protection ordinances would be required to address potential impacts on trees.

If construction occurs at night, then the necessary lighting would generate a temporary adverse impact on wildlife. Throughout much of the corridor, there is considerable night lighting close to the proposed alignments. Light impacts would not be expected to affect birds during the spring or fall migration because migrating birds would experience greater light impacts from the surrounding urban areas. With the implementation of mitigation measures to avoid impacts on nesting migratory birds (described below), potential light impacts during construction would not be adverse.

In summary, construction impacts under the BRT Alternative would include potential adverse impacts on the following vegetation and wildlife habitat resources:

- The urban tree inventory, due to tree removal. This impact would be reduced to a less than adverse level by compliance with local tree protection regulations.
- Migratory birds wherever tree clearing occurs. This impact would be reduced to a less than adverse level by the implementation of mitigation measures.

Mitigation measures would be required for compliance with the MBTA, with local tree protection ordinances, and to reduce potential impacts on wildlife habitat. Bird species that may utilize trees that could be removed or disturbed during construction could be affected. Potential mitigation measures that would reduce adverse impacts would include the following:

- Tree removal would be timed as much as possible to occur outside the migratory bird nesting season, which occurs generally from April 1–September 15 and as early as March 1 for some species.
- If construction must occur during the nesting season, two biological surveys would be conducted: one 15 days prior and a second 72 hours prior to the construction that would remove or disturb suitable nesting habitat. The surveys would be performed by a biologist with experience conducting breeding bird surveys. The biologist would prepare survey reports

documenting the presence or absence of any protected bird in the habitat to be removed and any other such habitat within 300 feet of the construction work area. If a protected bird is found, surveys would be continued in order to locate any nests. If an active nest is located, construction within 300 feet of the nest would be postponed until the nest is vacated and juveniles have fledged and when there is no evidence of a second attempt at nesting.

- Avoidance measures would be incorporated into the design of the project during preliminary engineering where feasible. However, if construction of the project requires removal of a protected tree, a permit would be required in accordance with applicable local codes and ordinances of the city in which the affected tree is located. Tree removal permits may require replanting of protected trees within the project area or at another location to mitigate for the removal of these trees. Replanting would be done according to the ratios required by tree removal permits and in a size that is appropriate for the species and setting as determined by an arborist. In addition, planted trees would be maintained such that ninety percent are in good condition after six months and irrigation would be carried out until the tree is established.

After mitigation, there would be no measurable impacts on biological resources remaining.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1.1 Segment UA (Vegetation Segments UA-1 to UA-3)

Vegetation segments UA-1 to UA-3 from the 95th Street Terminal to approximately 119th Street are in areas with existing rail service and urban levels of activity. Although the number of trains through the corridor would increase under the UPRR Rail Alternative, the noise and lighting levels would not increase appreciably from the existing condition.

Of all the alternatives, the ROW Option would have the least impact on existing vegetation, primarily removing young trees from the I-57 median. However, this area is isolated from other habitats by the freeways. In addition, these trees do not appear to be mature. The area would provide minimal potential for migratory bird use. Therefore, with compliance with local tree protection ordinances, potential impacts would not be adverse.

In addition, the largest block of habitat between 110th and 111th Streets would be affected by the proposed park & ride. This area has multiple vegetation layers and relatively mature trees, providing a relatively good patch of habitat for urban adapted species. The area would be used by migratory birds. Mitigation measures would be implemented during construction to avoid potential impacts (Section 5.2.2). After mitigation, there would be no measurable impacts on biological resources remaining.

5.3.1.2 Segment UB (Vegetation Segments UB and Station Options)

While a relatively large amount of habitat would be affected in Vegetation Segment UB, the area is dominated by young cottonwood trees and invasive, non-native species and represents low quality habitat. It is fragmented and somewhat isolated by the surrounding industrial and transportation land uses. The area provides habitat for migratory birds and may be somewhat more valuable than other areas due to its proximity to designated natural areas near Lake Calumet and the Calumet River. However, this added value would only be useful to more mobile species such as birds that can overcome the industrial and land use barriers between the API and other more natural areas.

Operations in Vegetation Segment UB would further fragment the existing habitats and introduce new activity levels into the area. Because the forest cover is not mature, the vegetation is dominated by early successional and invasive, non-native species. Because the area is surrounded by heavy industrial and transportation land uses, the area likely only provides habitat for urban-adapted species. Therefore, the potential impacts would not likely be adverse.

The 130th Street station South and West option sites of the UPRR Rail Alternative are in areas with existing rail service and urban levels of activity.

After mitigation, there would be no measurable impacts on biological resources remaining.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.2.1 Segment UA (Vegetation Segments UA-1 to UA-3)

A small number of trees would likely be removed as a result of construction activities in Segments UA-1 to UA-3 of the ROW Option. Most of the removal would likely occur at the park & ride facilities, and in the median of the freeway just south of the 95th Street Terminal.

As described for the BRT Alternative, compliance with local tree protection ordinances would result in less than adverse impacts on the human environment from tree removal. Additional mitigation measures may be required to reduce potential impacts on wildlife habitat. As it would be for the BRT Alternative, a detailed tree inventory would need to be prepared for each work zone during project permitting.

Night construction would generate a temporary adverse impact on wildlife, as described for the BRT Alternative. With the implementation of mitigation measures to avoid impacts on nesting migratory birds, potential light impacts during construction would not be adverse (See Section 5.2.2).

In summary, construction impacts under the UPRR Rail Alternative would include potential adverse impacts on the following vegetation and wildlife habitat resources:

- The urban tree inventory, due to tree removal. This impact would be reduced to a less than adverse level by compliance with local tree protection regulations.

- Migratory birds wherever tree clearing occurs. This impact would be reduced to a less than adverse level by the implementation of mitigation measures.

Potential mitigation measures that would reduce adverse impacts are discussed in Section 5.2.2. After mitigation, there would be no measurable impacts on biological resources remaining.

5.3.2.2 Segment UB (Vegetation Segments UB and Station Options)

Trees would be removed as a result of construction activities in UPRR Rail Alternative Segment UB. Some additional trees and low quality habitat, dominated by non-native invasive species, would be affected in the South and West Station Option locations.

As described for the BRT Alternative, compliance with local tree protection ordinances would result in less than adverse impacts on the human environment from tree removal. Additional mitigation measures may be required to reduce potential impacts on wildlife habitat. As it would be for the BRT Alternative, a detailed tree inventory would need to be prepared for each work zone during project permitting.

Night construction would generate a temporary adverse impact on wildlife, as described for the BRT Alternative. With the implementation of mitigation measures to avoid impacts on nesting migratory birds, potential light impacts during construction would not be adverse (See Section 5.2.2).

In summary, construction impacts under the UPRR Rail Alternative would include potential adverse impacts on the following vegetation and wildlife habitat resources:

- The urban tree inventory, due to tree removal. This impact would be reduced to a less than adverse level by compliance with local tree protection regulations.

- Migratory birds wherever tree clearing occurs. This impact would be reduced to a less than adverse level by the implementation of mitigation measures.

Potential mitigation measures that would reduce adverse impacts are discussed in Section 5.2.2. After mitigation, there would be no measurable impacts on biological resources remaining.

5.3.3 120th Street Yard and Shop

5.3.3.1 Permanent Impacts and Mitigations

See Section 5.3.1.2.

5.3.3.2 Construction Impacts and Mitigations

See Section 5.3.2.2.

Potential mitigation measures that would reduce adverse impacts are discussed in Section 5.2.2.

5.4 Union Pacific Railroad Rail Alternative - East Option

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.1.1 Segment UA (Vegetation Segments UA-1 to UA-3)

See Section 5.3.1.1. Although the East Option would affect a larger amount of vegetation than the ROW Option, the potential impacts would be similar to those described in Section 5.3.1.

5.4.1.2 Segment UB (Vegetation Segments UB and Station Options)

See Section 5.3.1.2.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.2.1 Segment UA (Vegetation Segments UA-1 to UA-3)

See Section 5.3.2.1. Although the East Option would affect a larger amount of vegetation than the ROW Option, the potential impacts would be similar to those described in Section 5.3.2.1.

5.4.2.2 Segment UB (Vegetation Segments UB and Station Options)

See Section 5.3.2.2.

5.4.3 120th Street Yard and Shop

See Section 5.3.4.

5.5 Union Pacific Railroad Rail Alternative - West Option

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.1.1 Segment UA (Vegetation Segments UA-1 to UA-3)

See Section 5.3.1.1. Of the UPRR options, the West Option would affect the greatest amount of vegetation, including several patches with relatively diverse vegetation regenerating in abandoned industrial sites between 108th and 111th Streets. The potential impacts would be similar to those described in Section 5.3.1.1.

5.5.1.2 Segment UB (Vegetation Segments UB and Station Options)

See Section 5.3.1.2.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.2.1 Segment UA (Vegetation Segments UA-1 to UA-3)

See Section 5.3.2.1.

5.5.2.2 Segment UB (Vegetation Segments UB and Station Options)

See Section 5.3.2.2.

5.5.3 120th Street Yard and Shop

See Section 5.3.4.

5.6 Halsted Rail Alternative

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

5.6.1.1 Segment HA (Vegetation Segments HA-1 to HA-3)

Halsted Street is currently developed with commercial land uses. The operation of an elevated rail line would have no impact on vegetation and wildlife habitats along this route.

5.6.1.2 Segment HB (Vegetation Segment HB)

Halsted Street is currently developed with commercial land uses. The operation of an elevated rail line would have no impact on vegetation and wildlife habitats along this route.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

5.6.2.1 Segment HA (Vegetation Segments HA-1 to HA-3)

A number of trees would likely be removed as a result of construction activities under the Halsted Rail Alternative. Most of the removal would likely affect trees from the Halsted Street median and sidewalks.

Compliance with local tree protection ordinances would result in less than adverse impacts on the human environment from tree removal. Additional mitigation measures, such as the measures to protect migratory birds as described in Section 5.2.2, may be required to reduce potential impacts on wildlife habitat. As it would be for the BRT Alternative and UPRR Rail Alternative, a detailed tree inventory would need to be prepared for each work zone during project permitting.

Night construction would generate a temporary adverse impact on wildlife, as described for the BRT Alternative. With the implementation of mitigation measures to avoid impacts on nesting migratory birds, potential light impacts during construction would not be adverse (See Section 5.2.2).

In summary, construction impacts under the Halsted Rail Alternative would include potential adverse impacts on the following vegetation and wildlife habitat resources:

- The urban tree inventory, due to tree removal. This impact would be reduced to a less than adverse level by compliance with local tree protection regulations.
- Migratory birds wherever tree clearing occurs. This impact would be reduced to a less than adverse level by the implementation of mitigation measures.

Suitable habitat for listed plant species does not appear to be present in the API.

Potential mitigation measures that would reduce adverse impacts are discussed in Section 5.2.2. After mitigation, there would be no measurable impacts on biological resources remaining.

5.6.2.2 Segment HB (Vegetation Segment HB)

See Section 5.6.2.1.

5.6.3 119th Street Yard and Shop

5.6.3.1 Permanent Impacts and Mitigations

There are a few relatively small patches of regenerating vegetation within the proposed yard and shop area that would be used by migratory birds. Mitigation measures would be implemented during construction to avoid potential impacts.

5.6.3.2 Construction Impacts and Mitigations

See Section 5.6.2.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

After mitigation, no measurable impacts on biological resources would remain.

6.2 Bus Rapid Transit Alternative

After mitigation, no measurable impacts on biological resources would remain.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

After mitigation, no measurable impacts on biological resources would remain.

6.4 Union Pacific Railroad Rail Alternative - East Option

After mitigation, no measurable impacts on biological resources would remain.

6.5 Union Pacific Railroad Rail Alternative - West Option

After mitigation, no measurable impacts on biological resources would remain.

6.6 Halsted Rail Alternative

After mitigation, no measurable impacts on biological resources would remain.

Disclaimer

The Illinois Natural Heritage Database cannot provide a conclusive statement on the presence, absence, or condition of natural resources in Illinois. This review reflects the information existing in the Database at the time of this inquiry, and should not be regarded as a final statement on the site being considered, nor should it be a substitute for detailed site surveys or field surveys required for environmental assessments. If additional protected resources are encountered during the project's implementation, compliance with applicable statutes and regulations is required.

Terms of Use

By using this website, you acknowledge that you have read and agree to these terms. These terms may be revised by IDNR as necessary. If you continue to use the EcoCAT application after we post changes to these terms, it will mean that you accept such changes. If at any time you do not accept the Terms of Use, you may not continue to use the website.

1. The IDNR EcoCAT website was developed so that units of local government, state agencies and the public could request information or begin natural resource consultations on-line for the Illinois Endangered Species Protection Act, Illinois Natural Areas Preservation Act, and Illinois Interagency Wetland Policy Act. EcoCAT uses databases, Geographic Information System mapping, and a set of programmed decision rules to determine if proposed actions are in the vicinity of protected natural resources. By indicating your agreement to the Terms of Use for this application, you warrant that you will not use this web site for any other purpose.

2. Unauthorized attempts to upload, download, or change information on this website are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and/or the National Information Infrastructure Protection Act.

3. IDNR reserves the right to enhance, modify, alter, or suspend the website at any time without notice, or to terminate or restrict access.

Security

EcoCAT operates on a state of Illinois computer system. We may use software to monitor traffic and to identify unauthorized attempts to upload, download, or change information, to cause harm or otherwise to damage this site. Unauthorized attempts to upload, download, or change information on this server is strictly prohibited by law.

Unauthorized use, tampering with or modification of this system, including supporting hardware or software, may subject the violator to criminal and civil penalties. In the event of unauthorized intrusion, all relevant information regarding possible violation of law may be provided to law enforcement officials.

Privacy

EcoCAT generates a public record subject to disclosure under the Freedom of Information Act. Otherwise, IDNR uses the information submitted to EcoCAT solely for internal tracking purposes.

1. The IDNR EcoCAT website was developed so that units of local government, state agencies and the public could request information or begin natural resource consultations on-line for the Illinois Endangered Species Protection Act, Illinois Natural Areas Preservation Act, and Illinois Interagency Wetland Policy Act. EcoCAT uses databases, Geographic Information System mapping, and a set of programmed decision rules to determine if proposed actions are in the vicinity of protected natural resources. By indicating your agreement to the Terms of Use for this application, you warrant that you will not use this web site for any other purpose.

2. Unauthorized attempts to upload, download, or change information on this website are strictly prohibited and may be punishable under the Computer Fraud and Abuse Act of 1986 and/or the National Information Infrastructure Protection Act.

3. IDNR reserves the right to enhance, modify, alter, or suspend the website at any time without notice, or to terminate or restrict access.

Security

EcoCAT operates on a state of Illinois computer system. We may use software to monitor traffic and to identify unauthorized attempts to upload, download, or change information, to cause harm or otherwise to damage this site. Unauthorized attempts to upload, download, or change information on this server is strictly prohibited by law.

Unauthorized use, tampering with or modification of this system, including supporting hardware or software, may subject the violator to criminal and civil penalties. In the event of unauthorized intrusion, all relevant information regarding possible violation of law may be provided to law enforcement officials.

Privacy

EcoCAT generates a public record subject to disclosure under the Freedom of Information Act. Otherwise, IDNR uses the information submitted to EcoCAT solely for internal tracking purposes.

Appendix C
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

This technical memorandum presents the potential effects of the Red Line Extension (RLE) Project on transportation-related energy consumption including fossil fuels and electric energy. Energy usage is associated with construction and operation of the proposed project. Net energy demand is associated with changes in travel patterns and mode choice within the regional transportation network related to the project.

Two components of energy consumption were examined: long-term energy consumption and short-term energy consumption. Long-term energy consumption is ongoing energy use that continues year after year. Analysis of long-term energy consumption changes included regional transportation-related energy consumption based on vehicle miles traveled (VMT) and transit operations. Annual VMT is the total number of miles driven by all vehicles within a year in a defined a geographic area. Annual VMT is an output of the Chicago Metropolitan Agency for Planning (CMAP) Travel Demand Model. Transit operations include energy for vehicle propulsion and operation of stations. The second component, short-term energy use, includes construction impacts, which are temporary. Construction impacts include production of materials used in construction and the operation of construction equipment.

Energy impacts are determined by comparing the energy consumption of build alternatives versus the No Build Alternative for the horizon year of 2030. Table 1-1 presents a summary of the energy for long-term energy consumption. As Table 1-1 shows, the difference in projected energy use (regional transportation plus transit operations) between any of the build alternatives and the No Build Alternative would not be greater than the margin of error for regional modeling.

The projected annual transportation-related energy consumption in the region for the No Build Alternative is approximately 368 trillion British thermal units (BTU), based on output from the CMAP Regional Travel Model. The projected regional travel demand for each of the build alternatives is marginally smaller than for the No Build Alternative. The build alternatives would result in 11.4 to 19.6 million fewer annual VMT than with the No Build Alternative.

All of the build alternatives would require energy for operations. The net difference in energy use for any of the build alternatives would be less than +/- 0.02 percent, which is smaller than the margin of error for regional modeling. The difference in energy use between any of the alternatives and the No Build Alternative (368 trillion BTU for regional vehicular travel in 2030) would be negligible and would not have an impact on regional energy consumption.

Table 1-1: Estimated Annual Long-Term Energy Use of Alternatives for Year 2030

Alternative	Estimated Annual Energy Use - Trillion BTU
No Build	368.3
Bus Rapid Transit	368.3
UPRR Rail Options	368.3
Halsted Rail	368.3

Total long-term energy is the sum of energy for regional vehicular travel, transit operations, and station energy.

The total operational energy is rounded to four significant digits, which is appropriate for the confidence level in the regional travel demand modeling. To show differences in estimated operational energy, display of five to six significant digits would be required.

BTU = British thermal unit, UPRR = Union Pacific Railroad

Energy would be required for construction of any of the build alternatives. For the rail alternatives, energy would be used for the production of the guideway and station components (including steel, cement, copper, and glass). Energy would also be used for the operation of construction equipment. Energy use by construction equipment would be localized and temporary. Construction energy use for the rail alternatives would be relatively large, because the rail alternatives would involve construction of elevated structures and substantial elevated stations. Table 1-2 summarizes energy consumption for construction. Construction energy use for the Bus Rapid Transit (BRT) Alternative would be relatively small. The BRT Alternative would use existing at-grade streets; therefore, construction of elevated guideways would not be required. Stops for the BRT Alternative would be at grade and would occupy a smaller footprint than the stations in the rail alternatives.

Table 1-2: Estimated Short-Term Energy Use of Alternatives

Alternative	Construction Energy Use - Billion BTU
No Build	0
Bus Rapid Transit	91
UPRR Rail - ROW Option	6,130
UPRR Rail - East Option	6,110
UPRR Rail - West Option	6,120
Halsted Rail	6,650

Notes:
Energy use is rounded in this summary table
BTU = British thermal unit, UPRR = Union Pacific Railroad,
ROW = right-of-way

The one-time irreversible commitment of energy resources for construction would amount to less than 1.3 percent of the total annual energy consumption for Cook County, which is 530 trillion BTU (CNT Energy 2009). Construction of any alternative would not have an impact on energy consumption in the area of potential impact (API), Cook County, or the Chicago Metropolitan Area.

Updated July 28, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix A of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix A supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the CMAP Fiscal Year 2010–2015 Transportation Improvement Program and the improvements to 95th Street Terminal. The Transportation Improvement Program projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

3.1 Regulatory Framework

3.1.1 Federal

The National Environmental Policy Act of 1969 (NEPA) requires that federal agencies consider environmental impacts before taking actions that could affect the human environment. As interpreted by the Council on Environmental Quality, NEPA requires that “reasonably foreseeable” impacts of a proposed action be considered in the decision making process. As defined by NEPA, the term “impacts” includes “aesthetic, historic, cultural, economic, social, or health” impacts. Energy use is one of the environmental elements typically assessed in NEPA documentation. Applicable federal regulation for the analysis of transit projects also includes the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) Public Law 109-59, August 10, 2005. SAFETEA-LU focuses on reducing traffic congestion, increasing intermodal connectivity, and protecting the environment. SAFETEA-LU gives state and local transportation decision makers more flexibility over previous legislation for solving transportation problems in their communities (Federal Highway Administration 2005). The Federal Public Transportation Act of 2012, effective October 1, 2012, continues reference to NEPA and does not alter the regulatory framework regarding evaluation of alternatives with regard to energy.

Title 42 of the United States Code (USC) concerns public health and welfare and has 159 chapters. The following sections of Title 42 of the USC focus on energy conservation, reduced reliance on foreign energy sources (mainly petroleum), use of alternative fuels, and increased efficiency in energy use:

- Providing for improved energy efficiency in motor vehicles (42 USC 6201)
- Increasing economic efficiency by meeting future needs for energy services at the lowest cost, considering technologies that improve the efficiency of energy end use, while conserving energy supplies such as oil (42 USC 13401)
- Reducing air, water, and other environmental impacts (including emissions of greenhouse gases) related to energy production, distribution, transportation, and use by development of an environmentally sustainable energy system (42 USC 13401)
- Reducing demand for oil in the transportation sector for all motor vehicles (42 USC 13431)

The Energy Policy Act of 2005 was amended and now supersedes several previous energy policy acts, including the National Energy Act of 1978 (PL 95-619), the Energy Policy and Conservation Act Amendments of 1985 (PL 99-58), and the Energy Policy Act of 1992 (PL 102-486). The Energy Policy Act of 2005 includes transportation-related provisions that reduce reliance on foreign energy sources (mainly petroleum) and increase use of recovered mineral content in federally funded projects involving procurement of cement or concrete.

3.1.2 State

The Illinois Sustainable Energy Plan (State of Illinois 2005) includes both a Renewable Energy Portfolio Standard and an Energy Efficiency Portfolio Standard for energy production and consumption in Illinois. This plan recommends an increase in percent of renewable energy in the portfolio of electric energy suppliers. There is no guidance in the plan for energy impact assessment.

3.1.3 Local

The City of Chicago's Energy Conservation Code was adopted by the City Council on November 5, 2008. The code is underpinned by the American Society of Heating, Refrigerating and Air-Conditioning Engineers/Illuminating Engineering Society of North America 90.1-2004. The code is related to residential and commercial buildings. While the code does not provide guidance for energy assessment of transportation systems, the code’s discussion of heat island effects may be applicable during design.

The Village of Calumet Park’s Code of Ordinances (§152.08) adopts the International Energy Conservation Code. The International Energy Conservation Code establishes minimum requirements for energy efficiency of commercial and residential buildings, but does not provide guidance for energy assessment of transportation systems.

3.2 Impact Analysis Thresholds

NEPA does not set specific thresholds of significance for energy impacts. Title 40 Code of Federal Regulations § 1502.16(e) directs that EISs include a discussion of the “energy requirements and conservation potential of various alternatives…natural or depletable resource requirements, and conservation potential of various alternatives,” and potential mitigation measures. For the purpose of this EIS, an impact would be adverse if it would result in a permanent increase in annual energy or fuel usage that could not be accommodated by the regional (Cook County) supply.

3.3 Area of Potential Impact

The project area is 11 miles south of the City of Chicago’s central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway (I-57) and I-94 Bishop Ford Freeway (I-94) cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The South Red Line currently terminates at the 95th Street Terminal. The API (Figure 3-1) for the operational energy analysis was defined as follows:

- On the north by 91st Street (four blocks north of the existing 95th Street Terminal)
- On the south by a varying boundary that includes Jackson Street/134th Street (four blocks south of both the UPRR Rail Alternative and Halsted Rail Alternative terminal) station locations
- On the east by a varying boundary that includes Martin Luther King Drive, Michigan Avenue, and I-94 (from the north to south)
- On the west by a varying boundary that includes Halsted Avenue, Vincennes Avenue, and I-57 (from north to south)

While the project would occur within the API, both long-term (vehicular and transit operations) and short-term (construction) energy use associated with the project would extend well outside the API. Changes in vehicular energy use would be regional because a portion of travelers would change modes from automobile to transit for trips between the project area and downtown Chicago. Because changes in vehicular energy use would be regional, the regional CMAP travel demand model was used to assess changes in VMT. This regional model includes the six-county metropolitan area.

Energy for transit operations and for construction was determined for the API; however, energy use would be distributed well beyond the API. Only energy use caused by the project is assessed in this document. For transit operations, energy generation can be dispersed over a wide region. For instance, electric power generation for rail transit can take place anywhere within a 13-state region. Manufacture of materials (such as rail, reinforcement steel, and cement) for the project would also be distributed well beyond the API. Construction energy includes manufacture of components, transportation to the project site, and the localized construction activities.

Figure 3-1: Energy Area of Potential Impact

3.4 Methods

The following methods were used to determine impacts for energy consumption under the No Build Alternative and the build alternatives.

The construction and operation (bus operations and stops, or rail operations and stations) energy usage was calculated for each of the build alternatives. The alternatives considered for the RLE were measured against the baseline conditions (No Build Alternative). The methods for calculating long-term (regional vehicular travel and transit operations) and short-term (construction) energy usage are described below.

Long-Term Energy Analysis

The baseline energy consumption was determined from the total regional VMT for the No Build Alternative in 2030, as estimated by the CMAP regional travel demand model. The entire CMAP region was used in assessing vehicular travel, because the project would affect travel outside of the API. The VMT was then converted to BTU using 3,650 BTU per vehicle mile traveled, a value derived from an estimated achieved fuel economy of 34.5 miles per gallon for cars and light trucks in 2025 from Corporate Average Fuel Economy standards (National Highway Traffic Safety Administration 2012).[1] (Miles traveled by transit vehicles, other than those associated with the project, would not differ among the alternatives; therefore, separating out transit vehicles and applying different energy consumption factors is not necessary to calculate the difference in energy use between the build alternatives and the No Build Alternative.) Any of the build alternatives would result in lower regional VMT than with the No Build Alternative, and would thus result in less vehicular energy consumption than the No Build Alternative. Energy consumption by vehicles is primarily in the form of gasoline and diesel fuel.

For the BRT Alternative, operational energy consumption was calculated from additional annual bus miles and the national average BTU per bus mile from the United States Department of Energy's Energy Data Book (Edition 31). The BRT stop energy was calculated from total platform area and estimated energy use per square foot (primarily for lighting) from *Transit Cooperative Research Board Project J-11/Task 9* (Center for Neighborhood Technology 2010).[2]

---

[1] A gallon of gasoline supplies 125,000 BTU. A gallon of diesel fuel supplies 139,000 BTU. For future years, the estimated 2025 achievable fleet-wide fuel economy of 34.5 miles per gallon is used (forecast under the Corporate Average Fuel Economy "No Action" Alternative). Diesel was estimated to make up a higher percentage of fleets (compared to only 2.9 percent in 2012) because diesel automobiles get better mileage per gallon than gasoline automobiles. For the energy calculations, 6.6 percent was used for the percentage of diesel vehicles in future analysis years.

[2] Average building energy use for the buildings in the research is 89,900 BTU per square foot per year, with 52 percent used for heating, ventilation, and air conditioning, and 20 percent used for lighting. For BRT platforms, where the primary energy use is lighting, 20 percent (or 18,000 BTU per square foot) was applied.

For the rail alternatives, operational energy consumption was calculated from the total additional annual railcar miles and the average kilowatt-hour per revenue car mile provided by CTA.[3] Kilowatt-hours were then converted to BTU. Station energy was calculated based on similar CTA Red Line elevated stations (based on 2010 data provided by CTA). Table 3-1 lists the energy use factors for operations.

Table 3-1: Energy Use Factors for Operations

Operational Element	Operational Energy Use (BTU)	Primary Source of Energy
Transit Bus	36,000 BTU/vehicle mile	Diesel Fuel
CTA Railcar	26,785 BTU/revenue car mile	Electricity
Platform Lighting	18,000 Annual BTU/square foot	Electricity
ADA Accessible Elevated Station	1,700 Million BTU Annually/station	Electricity
Elevators	25,000,000 Annual BTU (each)	Electricity
Escalators	70,000,000 Annual BTU (each)	Electricity

BTU = British thermal unit, CTA = Chicago Transit Authority, ADA = Americans with Disabilities Act

Construction Energy Analysis

The construction energy consumption was evaluated for each of the build alternatives to determine the short-term impacts of the project on the regional energy use. Capital cost estimates were used to determine the construction energy consumption by applying an energy cost factor from *Energy and Transportation Systems* (California Department of Transportation 1983). Energy was expressed using BTU. The reference document states energy use per construction dollar (shown in Table 3-2) should be viewed as “informed estimates.” Energy use includes both manufacture of components and construction activities to install the components.

---

[3] A revenue car mile is one CTA rail car traveling 1 mile while in revenue service. Energy use per revenue car mile was provided by CTA. The figure is for 2010 and is based on the system-wide average. The energy use may decrease with future vehicles and use of regenerative braking.

Table 3-2: Energy Factors for Construction

Construction Element	Construction Energy Cost Factor (BTU/$)[1]	Typical Elements
Track and Guideway	5,940	Structures, Track, Steel, Concrete
Stations	5,940	Platform, Canopy, Stairs, Escalator, Elevator, Station House
Facilities	7,310	Maintenance Building and Yard
Site Work	5,940	Utilities, Excavation, Removal, Hauling
Systems	9,130	Communications, Signals, Fare Collection, Traction Power, Substations

BTU = British thermal unit

1. Construction energy per dollar figures are for 2012, derived from *Energy and Transportation Systems* (California Department of Transportation 1983).

Section 4
Affected Environment

According to the City of *Chicago Climate Action Plan*, prepared in 2008, 21 percent of the city's greenhouse gas emissions are produced by cars, trucks, buses, and trains. Regional daily VMT are projected by the CMAP 2030 regional travel model to be 276,438,000. On an average weekday, over 1.6 million trips are made on CTA trains and buses (as of January 2013). If these trips were made in passenger vehicles rather than on CTA trains and buses, several hundred thousand vehicles would potentially be added to the regional roads each weekday.

To reduce its emission of greenhouse gases and energy use, the CTA is implementing the use of diesel-electric hybrid buses and exploring green technologies such as all-electric buses. The CTA has upgraded its support vehicle fleet to include hybrid-electric vehicles, vehicles that can use E-85 fuel, and vehicles that run on compressed natural gas. The E-85 fuel and compressed natural gas have a lower equivalent BTU amount than gasoline. The CTA is working to decrease the environmental impact of rail stations, offices, and maintenance facilities by implementing sustainable features in new buildings and retrofitting existing buildings to increase energy efficiency. The CTA currently uses approximately 9.8 trillion BTU annually for rail operations. (As Section 5 describes, any of the rail alternatives would result in 1.3 percent more energy use than the No Build Alternative.)

The CTA receives its power from Commonwealth Edison Company (purchased primarily from alternative retail electricity suppliers). Commonwealth Edison is part of the PJM Interconnection (PJM, a regional transmission organization) territory, which includes all or part of 13 states and the District of Columbia. The PJM region has 214,000 square miles, a population of about 60 million and a peak demand of 158,448 megawatts (in 2011). Renewable energy sources account for 5.3 percent of the total generating capacity for the region, which is 185,600 megawatts. The difference between the peak demand and the existing generating capacity is called the surplus generating capacity and is equal to 27,000 megawatts. (As Section 5 describes, the additional demand from the project would be less than 0.02 percent of the surplus generating capacity in the regional transmission territory.) As of June 27, 2011 there were 88,674 megawatts of planned generating station projects (in addition to existing generating capacity) for the PJM, and renewable energy sources account for 48.3 percent of the proposed projects. (PJM 2012)

Section 5
Impacts and Mitigations

This section describes the energy impacts for each of the four alternatives under consideration for the RLE Project, including the No Build Alternative. Impacts are discussed in three categories for each alternative: long-term operational impacts, short-term construction impacts, and cumulative impacts. Long-term operational impacts would occur after the project is fully constructed and operational. Long-term impacts include both regional vehicular travel and transit operations. Construction impacts would occur during the construction phase of the project and would be temporary in nature. Cumulative impacts would result from the incremental impact of the alternative combined with other past, present, and reasonably foreseeable future actions.

While other technical memoranda analyze alternatives by segment, the affected environment for energy is regional and widespread. (Compare the affected environment for energy with that of noise, for example. Noise generation occurs along the corridor and affects receptors adjacent to the corridor, and analysis within any discrete geographic area can be performed. Energy use, in contrast, is regional. Energy sources—whether for electricity, gasoline, or manufacture of construction components—extend far beyond the corridor.) See further discussion on page 3-3 of this technical memorandum.

A summary of impacts is presented and discussed below for all alternatives. Please see Sections 5.1 through 5.6 for specific details regarding impacts for the alternatives.

Table 5-1 provides a summary of the differences in long-term energy between the build alternatives and the No Build Alternative. The total long-term energy use for the No Build Alternative in 2030 would be approximately 368 trillion BTU, almost all of which would be the energy use of regional vehicular travel. The BRT Alternative would result in slightly less energy use than the No Build Alternative. The rail alternatives would require slightly more long-term energy than the No Build Alternative. Compared to the energy use for the No Build Alternative, the difference in energy use with any build alternative would be less than 0.02 percent of the total long-term energy use. The scale of the difference (less than 65 billion BTU annually) would be very small in comparison to the total operational energy use (approximately 368 trillion BTU annually). The percentage difference (less than 0.02 percent) would be less than the margin of error for regional modeling and less than the margin of error for assumptions regarding future automobile, bus, and rail vehicle energy efficiency. The additional demand from the project would be less than 0.02 percent of the surplus generating capacity in the regional transmission territory (See Section 4). Operation of any of the alternatives would not have an impact on regional energy consumption.

Table 5-2 provides a summary of the construction energy for alternatives. Energy used for construction is a one-time irreversible commitment of resources. Construction energy for the BRT Alternative would be relatively small compared to the rail alternatives, as the BRT Alternative features would be at grade. In contrast, construction for the rail alternatives would involve elevated structures and substantial stations.

Table 5-1: Estimated Difference in Long-Term Energy Use of Alternatives for Year 2030 (Billion BTU Annually)

Alternative	Regional Vehicular Travel	Operation of Alternative	Energy Use at Stations	Total Long-Term Energy
No Build	0	0	0	0
Bus Rapid Transit	(41.5)	21	0.2	(20.3)
UPRR Rail	(71.6)	128	6.8	63.2
Halsted Rail	(68.5)	121	7.5	59.9

() Parentheses indicate a negative difference in energy use (a lower estimate of energy use than for the No Build Alternative). All UPRR Rail Alternative Options would have the same operational energy use. Transit operational energy (including transit vehicle operations and energy use at stops/stations) for any of the rail alternatives would represent an increase of approximately 1.3 percent over existing CTA rail energy use.

BTU = British thermal unit, UPRR = Union Pacific Railroad

Table 5-2: Estimated Short-Term Energy Use of Alternatives

Alternative	Construction Energy Use - Billion BTU
No Build	0
Bus Rapid Transit	91
UPRR Rail - ROW Option	6,130
UPRR Rail - East Option	6,110
UPRR Rail - West Option	6,120
Halsted Rail	6,650

Energy use is rounded in this summary table.

BTU = British thermal unit, UPRR = Union Pacific Railroad,
ROW = right-of-way

5.1 No Build Alternative

The No Build Alternative is the baseline against which the build alternatives are compared. The baseline condition (year 2030 conditions) is the energy usage that would occur under the No Build Alternative. The energy usage under this alternative is based on the predicted increase (from existing conditions) in VMT if none of the build alternatives are implemented.

5.1.1 Permanent Impacts and Mitigations - No Build Alternative

Under the No Build Alternative, travel patterns are assumed to remain the same as under existing conditions. Existing bus routes within the project area are expected to remain the same as under existing conditions. Regional daily VMT is projected by the CMAP 2030 regional travel model to be 276,438,000 miles per day.

5.1.2 Construction Impacts and Mitigations - No Build Alternative

No new infrastructure would be constructed as part of the No Build Alternative other than projects already committed through the CMAP Transportation Improvement Program and regular maintenance of existing track and structures. This alternative would not result in energy impacts related to construction activities.

5.2 Bus Rapid Transit Alternative

The BRT Alternative would add a limited-stop, enhanced bus route along the existing #34 Michigan Avenue bus route to 130th Street. The BRT Alternative would utilize traffic signal priority at signalized intersections along 95th Street, Michigan Avenue, and 130th Street. No dedicated bus lanes would be provided for the BRT Alternative. The BRT Alternative would require a net increase of twelve 60-foot articulated buses plus two spares.

The BRT Alternative bus would run 24 hours per day. Bus frequencies would be adjusted during peak periods to a 4-minute frequency between 6 AM and 8 PM on weekdays and a 12-minute frequency on the existing route #34 to better serve anticipated demand.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

Permanent (long-term) impacts would include three components: change in regional VMT, energy use for the transit vehicles, and energy use for the stops. The BRT Alternative would decrease regional VMT due to changes in vehicular trip distance (as BRT stops with the project would be closer to trip origins) and mode shift from personal vehicles to transit. The projected regional daily VMT for this alternative in the CMAP 2030 model would be 276,407,000, or approximately 31,000 VMT per day lower (less than 0.02 percent) than with the No Build Alternative. At 3,650 BTU per vehicle mile traveled, this would equate to an annual difference in energy use of 41.5 billion BTU.

The BRT Alternative would result in approximately 583,000 more bus miles annually than with the No Build Alternative. At 36,000 BTU/bus-mile, energy use for bus operations associated with this alternative would be 21 billion BTU more than with the No Build Alternative (U.S. Department of Energy 2012).

The third component of energy use is the operation of additional bus stops. The BRT stops would have bus shelters; therefore, the energy use would primarily be for lighting. Using 18,000 BTU per square foot of platform, the BRT platforms would require approximately 216 million BTU annually. Energy consumption for stops would be primarily electric energy.

As shown in Table 5-1, the total annual operational energy for the BRT Alternative would be approximately 20.3 billion BTU less than with the No Build Alternative. The total annual difference in long-term energy includes the total of the difference in energy for regional vehicular travel plus operational energy requirements for the transit vehicles and BRT stops.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

Energy impacts from construction activities were computed based on typical values for construction categories. Table 5-3 provides a summary of construction energy consumption for the BRT Alternative. Construction energy use would be a very small fraction of energy use in the region. The estimated 91 billion BTU for construction of the BRT Alternative would be less than 0.02 percent of the Cook County annual energy use, which is 530 trillion BTU. This 0.02 percent portion is well within the variations in annual energy use due to fluctuations in average temperature, regional employment, and manufacturing. The BRT Alternative would result in no construction energy impact and no mitigation is proposed.

Table 5-3: Estimated Energy Consumption from Construction Activities - Bus Rapid Transit Alternative

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Guideway	5,940	239	1	Concrete, Reinforcing Steel
Stops	5,940	702	4	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures
Maintenance Facilities	7,310	0	0	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	7,990	48	Earthwork, Removals, Utility Relocations
Systems	9,130	4,130	38	Signals, Fare Vending, Communications, Traffic Signal Priority System
Total Estimated Construction BTU			91	

BTU = British thermal units *All construction estimates in this document use April 2013 draft estimates.*

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would place the CTA tracks in the UPRR ROW between I-57 and the Canadian National/Metra Electric tracks. The UPRR trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation.

Operation for the ROW Option would have train sets consisting of eight cars. Although the proposed platform design would accommodate ten-car trains, the service plan would be for eight-car trains as are in operation today. The hours of operation for the UPRR Rail Alternative would be the same as for the current Red Line, which operates 24 hours every day of the year.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

The ROW Option would result in lower regional VMT than the No Build Alternative because of vehicular trip distance changes (people would be nearer to transit stations) and mode changes (people would change their travel mode from personal vehicles to transit). The projected regional daily VMT for the UPRR Rail Alternative in the CMAP 2030 model is 276,384,000, which would be approximately 53,700 VMT per day less than with the No Build Alternative. At 3,650 BTU per vehicle mile traveled, the annual energy use with the ROW Option would be 71.6 billion BTU less than with the No Build Alternative.

The ROW Option would result in approximately 4,774,000 more railcar-miles annually than with the No Build Alternative. At 26,785 BTU/railcar-mile, annual energy use for rail operations associated with the ROW Option would be 127,873 million BTU more than with the No Build Alternative. Energy use per railcar-mile is based on CTA's actual traction power use and actual revenue railcar-miles.

The third component of energy use is operation of stations. Using the methods described in Section 3.4, the four stations associated with the ROW Option would use approximately 6.8 billion BTU annually.

The total annual long-term energy for the ROW Option would be a 63.2 billion BTU higher than it would be with the No Build Alternative. The rail alternatives would be more operationally intensive than the BRT Alternative, so overall energy use would be greater. The rail alternatives would provide six times the annual passenger capacity of the BRT Alternative.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

Energy impacts from construction activities were computed based on typical values for construction categories. Construction energy use would vary slightly between the UPRR Rail Alternative options. For the UPRR Rail Alternative ROW Option, Table 5-4 provides a summary of the energy use during construction. Construction energy use would be a very small fraction of energy use in the region—approximately 6 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, or less than 1.2 percent of the total annual Cook County energy consumption. There would be no temporary energy impacts and no mitigation is proposed.

Table 5-4: Estimated Energy Consumption from Construction Activities - Union Pacific Railroad Rail Alternative - Right-of-Way Option

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	245,000	1,455	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	138,000	820	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	154,000	1,126	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	104,000	618	Earthwork, Removals, Utility Relocations

Systems	9,130	231,000	2,109	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,128	

BTU = British thermal units

5.4 Union Pacific Railroad Rail Alternative - East Option

In the UPRR Rail Alternative East Option, CTA tracks would be placed immediately adjacent to and east of the UPRR ROW between I-57 and the Canadian National/Metra Electric tracks. The service plan would be for eight-car trains and 24-hour service, as described for the ROW Option in Section 5.3.

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Because the operational energy consumption is calculated based on regional VMT and operation of the trains and stations, the energy consumption for the UPRR Rail Alternative East Option would be the same as for the ROW Option. The total annual operational energy would be 68.6 billion BTU more than with the No Build Alternative.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Table 5-5 provides a summary of construction-related energy use for the UPRR Rail Alternative East Option. Construction energy use would be a very small fraction of the energy use in the region—approximately 6 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, or less than 1.2 percent of the total annual Cook County energy consumption. There would be no temporary impacts on energy and no mitigation is proposed.

Table 5-5: Estimated Energy Consumption from Construction Activities - Union Pacific Railroad Rail Alternative - East Option

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	243,000	1,443	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	138,000	820	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	154,000	1,126	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	100,000	594	Earthwork, Removals, Utility Relocations
Systems	9,130	233,000	2,127	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,110	

BTU = British thermal units

5.5 Union Pacific Railroad Rail Alternative - West Option

In the UPRR Rail Alternative West Option, CTA tracks would be placed immediately adjacent to and west of the UPRR ROW between I-57 on the north end and the UPRR tracks near Kensington Park on the south end. The service plan would be for eight-car trains and 24-hour service, as described for the ROW Option in Section 5.3.

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

Because the operational energy consumption is calculated based on regional VMT and operation of the trains and stations, the energy consumption for the UPRR Rail Alternative West Option would be the same as for the ROW and East Options. The total annual operational energy would be 68.6 billion BTU more than it would be with the No Build Alternative.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

Table 5-6 provides a summary of construction-related energy use for the UPRR Rail Alternative West Option. Construction energy use would be a very small fraction of the energy use in the region—approximately 6 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, or less than 1.2 percent of the total annual Cook County energy consumption. There would be no temporary energy impacts and no mitigation is proposed.

Table 5-6: Estimated Energy Consumption from Construction Activities - Union Pacific Railroad Rail Alternative - West Option

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	246,000	1,461	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	138,000	820	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	154,000	1,126	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	102,000	606	Earthwork, Removals, Utility Relocations
Systems	9,130	231,000	2,109	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,122	

BTU = British thermal unit

5.6 Halsted Rail Alternative

The proposed Halsted Rail Alternative is a 5.0-mile extension of the existing Red Line. It would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The service plan would be for eight-car trains and 24-hour service, as described for the ROW Option in Section 5.3.

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

The Halsted Rail Alternative would result in lower regional VMT than the No Build Alternative because of vehicular trip distance changes (people would be nearer to transit stations) and mode changes (people would change their travel mode from personal vehicles to transit). The projected regional daily VMT for the Halsted Rail Alternative in the CMAP 2030 model is 276,387,000, which would be approximately 51,400 vehicle miles per day less than with the No Build Alternative. At 3,650 BTU per vehicle mile traveled, the annual energy use would be 68.5 billion BTU less than with the No Build Alternative.

The Halsted Rail Alternative would result in approximately 4,504,000 more railcar-miles annually than with the No Build Alternative. At 26,785 BTU/railcar-mile, additional annual energy use for rail operations associated with this alternative would be 121 billion BTU more than with the No Build Alternative.

The four stations associated with the Halsted Rail Alternative would use approximately 7.5 billion BTU annually. This energy use would be higher than with the UPRR Alternative options because the Halsted Alternative's side platforms would require additional vertical circulation.

The total annual long-term energy for the Halsted Rail Alternative would be a 59.9 billion BTU higher than it would be with the No Build Alternative.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

Table 5-7 provides a summary of the energy use during construction for the Halsted Rail Alternative. Construction energy use would be a very small fraction of energy use in the region—approximately 7 trillion BTU compared to the total annual Cook County energy consumption of 530 trillion BTU, or less than 1.3 percent of the total annual Cook County energy consumption. There would be no temporary energy impacts and no mitigation is proposed.

Table 5-7: Estimated Energy Consumption from Construction Activities - Halsted Rail Alternative

Construction Component	BTU/2012$	Construction Estimate (2012 $1,000)	Billion BTU	Typical Elements
Track and Guideway	5,940	337,000	2,002	Structural Steel, Track, Concrete, Reinforcing Steel
Stations	5,940	140,000	832	Concrete, Reinforcing Steel, Canopy, Conduits, Lighting Fixtures, Glass
Maintenance Facilities	7,310	147,000	1,075	Maintenance Building, Equipment, Heating, Ventilation, Air Conditioning
Site Work	5,940	93,000	552	Earthwork, Removals, Utility Relocations
Systems	9,130	240,000	2,191	Signals, Fare Vending, Communications, Traction Power, Substations
Total Estimated Construction BTU			6,652	

BTU = British thermal unit

5.7 Cumulative Impacts

As energy use for all build alternatives would be a small fraction of regional energy use, and as projected surplus generating capacity also far outweighs energy use for any build alternative, there would be no cumulative impacts.

There are no planned major highway projects (such as I-94 or I-57) that would affect regional energy use. Other than the 95th Street Terminal, there are no planned CTA projects in the projects beyond the RLE Project. One CREATE (Chicago Region Environmental and Transportation Efficiency Program) project (grade separation of 95th Street and the Union Pacific tracks, CREATE project GS21a) is located within the project area and is listed as a future grade separation project that depends on future availability of funding.

Section 6
Conclusions

For any of the build alternatives, the permanent changes in energy use would amount to less than 0.02 percent of transportation-related energy use for the region (63 billion BTU more for the UPRR Alternative than for the No Build Alternative, which would require 368 trillion BTU). The energy needed for operations would be far less than the existing surplus generating capacity for the region (which is 17 percent greater than existing generating demand). The net difference in energy use for any of the build alternatives would be less than +/- 0.02 percent, which is smaller than the margin of error for regional modeling. The difference in energy use would be negligible for any of the alternatives compared to the energy use for the No Build Alternative (368 trillion BTU for regional vehicular travel in 2030) and would not have an impact on regional energy consumption.

For all of the build alternatives, the total temporary construction energy use would be less than 1.3 percent of the total annual energy consumption in Cook County. Construction energy use would be spread out over the duration of construction, approximately 3 to 5 years. The one-time irreversible commitment of energy resources for construction would have negligible impacts, if any.

Appendix A
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.
- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.
- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.
- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.
- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Energy

CTA revised cost estimates for the East and West Options after completing the additional engineering on those options in late 2014 and early 2015. Based on the refined alignments, the East Option would use approximately 6,130 billion BTU for construction and the West Option would use approximately 6,170 billion BTU for construction.

The one-time irreversible commitment of energy resources for construction would amount to less than 1.2 percent of the total annual energy consumption for Cook County, which is 530 trillion BTU (CNT Energy 2009).

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on Environmental Justice. The Environmental Justice analysis and outreach process was undertaken to accomplish the following goals, consistent with Federal Transit Administration (FTA) Circular 4703.1, *Environmental Justice Policy Guidance for Federal Transit Administration* (August 2012), and Circular 4702.1B, *Title VI Requirements and Guidelines for Federal Transit Administration Recipients* (October 2012):

- To avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations.
- To ensure the full and fair participation by all potentially affected communities in the transportation decision-making process.
- To prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations.

The analysis and outreach process is also consistent with the legislation that defines requirements for Environmental Justice compliance: the February 1994 Executive Order (EO) 12898, *Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations,* and the May 2012 U.S. Department of Transportation (USDOT) Order 5610.2, *Order to Address Environmental Justice in Minority Populations and Low-Income Populations*.

Although projects in areas comprising entirely Environmental Justice populations do not necessarily preclude disproportionately high and adverse effect findings, the following characteristics are true of the project area and the RLE alternatives:

- The entire project area comprises predominantly minority populations. No community in the project area contains less than 92.9 percent minority populations, and the project area as a whole contains 97.9 percent minority populations.
- All of the impacts and benefits of the alternatives would accrue to the same minority populations, and few project benefits would occur outside the project area.
- The purpose of this community-initiated project includes connecting disadvantaged communities to Chicago's major employment and activity centers in an effort to spur economic development and improve livability. The project would help remediate the geographic isolation and lack of employment and development opportunities that currently exist in the project area.

Given these findings, none of the alternatives would result in disproportionately high and adverse effects on Environmental Justice populations. Some alternatives would still have adverse impacts on Environmental Justice communities; however, these impacts would not be disproportionate. In some instances, impacts would remain adverse despite implementation of mitigation measures, as shown in Table 1-1 and described further in Section 5. These remaining adverse impacts would be associated with the change in community and visual character caused by locating an elevated rail structure and parking structures in low-density residential areas. In the case of the Halsted Rail Alternative, impacts would also stem from the proximity of the elevated rail structure to historic resources.

Table 1-1: Adverse Impacts Remaining After Mitigation by Alternative (Not Disproportionate)

Reference to the public involvement summary in Section 7 to be added following completion of the Environmental Justice outreach process.

Updated July 29, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix B of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix B supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program, which includes the improvements to 95th Street Terminal. The Transportation Improvement Program projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

According to EO 12898 signed in February 1994 and the guidance provided in FTA Circular 4703.1, *Environmental Justice Policy Guidance for Federal Transit Administration* issued in August 2012, the Environmental Justice process and analysis developed for the RLE Project is designed to achieve the following:

- Avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations.
- Ensure the full and fair participation by all potentially affected communities in the transportation decision-making process.
- Prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations.

The Environmental Justice analysis for the RLE Project is consistent with the August 2012 FTA Circular and is tailored to the unique characteristics and needs of the population in the area. Because the entire project area consists of predominantly African American populations with some Spanish-speaking groups, as discussed further in Section 4, all public outreach efforts were targeted to Environmental Justice populations. In addition to traditional public meetings and internet-based outreach, information about the project and opportunities for input were provided through newsletters, standing community group meetings, and individual stakeholder interviews to ensure full and fair participation. Information gathered during stakeholder interviews was used to plan focused, grassroots meetings to work through community concerns and identify appropriate mitigation measures. All outreach was conducted in both English and Spanish languages. Concerns about potential impacts raised during outreach were analyzed in conjunction with the impacts from the other RLE technical reports to determine whether disproportionately high and adverse effects would potentially occur. The results of the impact analysis are presented in detail in Section 5.

3.1 Regulatory Framework

The following subsections summarize the federal and related state laws that define Environmental Justice requirements for federally funded transit projects. The Environmental Justice analysis and outreach process for the RLE Project was conducted in accordance with these requirements. The methods outlined in the cited guidance documents were used to develop the methods for this analysis, as described in Sections 3.2 through 3.4 below.

3.1.1 Federal

Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Population and Low-Income Populations* (1994), requires each federal agency "to make achieving Environmental Justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority and low-income populations" (Federal Register, Volume 59, No. 32, 7629-7633, February 16, 1994). Each federal agency must analyze the environmental impacts, including human health, economic, and social impacts, of federal actions including impacts on minority and low-income communities, when such analysis is required by NEPA. Federal agencies are also required to provide opportunities for community input in the NEPA process, identify potential impacts and mitigation measures in consultation with affected communities, and improve the accessibility of meetings, crucial documents, and notices (Council on Environmental Quality 1997).

As discussed above, FTA issued its most recent guidance for meeting the requirements of EO 12898 as Circular 4703.1 in August 2012. The circular provides recommendations for the following:

- Identifying low-income and minority populations using Census data, outreach, and field observations.
- Determining whether disproportionately high and adverse effects would occur as a result of the project.
- Implementing traditional and non-traditional public outreach methods to ensure effective engagement of minority and low-income communities in the planning and decision-making process.
- Incorporating Environmental Justice into the NEPA process.

These recommendations have been incorporated as guiding principles into the analysis and outreach performed for the RLE Project. More detailed information regarding the specific methods used to comply with these recommendations is provided in Section 3.4.

Executive Order 13166 (2000), *Improving Access to Services for Persons with Limited English Proficiency (LEP),* requires that people who are not proficient in the English language have access to meaningful communications about and participation in any program or activity receiving federal assistance. It requires federal agencies to examine the services they provide for persons who, as a result of national origin, have LEP. It calls for agencies to identify whether LEP populations are in need of their services, and to develop and implement a system to provide those services so LEP persons can have meaningful access to them. The LEP analysis for the RLE Project is attached to this technical memorandum as Appendix A. The LEP analysis states that outreach for the project should be conducted in both English and Spanish languages.

In May 2012, the USDOT issued Order 5610.2, *Order to Address Environmental Justice in Minority Populations and Low-Income Populations,* in compliance with the February 1994 EO 12898. It provides guidance for transportation agencies to achieve Environmental Justice and establishes a policy to promote the principles of Environmental Justice in all USDOT programs, policies, and activities. It also requires that Environmental Justice principles be fully considered throughout planning and decision-making processes. The Environmental Justice analysis for the RLE Project incorporates the direction from Order 5610.2 (May 2012) as referenced and interpreted in FTA Circular 4703.1 (August 2012).

Title VI, which is related to Environmental Justice, imposes a statutory obligation on FTA recipients to (1) ensure that the level and quality of public transportation service is provided equitably without regard to race, color, or national origin; (2) promote full and fair participation in public transportation decision-making without regard to race, color, or national origin; and (3) ensure meaningful access to transit-related programs and activities by persons with LEP. A separate Title VI analysis will be prepared for this project by CTA.

3.1.2 State

Article XI of the *Constitution of the State of Illinois* (Article XI) establishes the legislative responsibility of the state "to provide and maintain a healthful environment for the benefit of this and future generations" and provides each person with the individual right to a "healthful environment" (Illinois General Assembly, Constitution of the State of Illinois).

In furtherance of Article XI, State Bill 2193, referred to as the Environmental Justice Act, was enacted on August 16, 2011 and established the Commission on Environmental Justice in the state of Illinois. The Commission on Environmental Justice is charged with advising state entities on Environmental Justice issues, reviewing and analyzing current state laws and policies, and recommending options to rectify Environmental Justice concerns. This Act ensures that no segment of the population in the state of Illinois, "regardless of race, national origin, age, or income, should bear disproportionately high or adverse effects of environmental pollution" (Illinois General Assembly, Public Act 097-0391). Demographic analysis of elderly populations is included in Section 4 to address these goals.

3.1.3 Local

Local agencies are subject to the above federal and state laws, as applicable. Cook County, the City of Chicago, and the Village of Calumet Park do not have additional regulatory requirements pertaining to Environmental Justice.

3.2 Impact Analysis Thresholds

3.2.1 Environmental Justice Populations

The FTA's Circular 4703.1 (August 2012) recommends identifying minority and low-income populations using a combination of Census data analysis and non-traditional data gathering techniques such as outreach to community-based organizations. Census data was used to preliminarily identify minority and low-income populations. Preliminary identifications were then supplemented with field visits (windshield and walking surveys conducted in 2012) and stakeholder outreach to confirm the presence of minority and low-income populations. Based on field observation and research, the Census tract and block-group boundaries used do not artificially dilute or inflate the affected minority population and/or low-income population findings, and allow for differentiation of impacts around the yard and shop locations versus those around the alternative alignments. A LEP analysis was also performed to identify populations in the project area who are linguistically isolated and do not speak English well. The LEP analysis results are included in this technical memorandum as Appendix A.

3.2.2 Disproportionately High and Adverse Effects

Once Environmental Justice populations were identified in all parts of the project area, analysis was performed to identify potentially adverse impacts and to verify that no disproportionately high and adverse effects would occur. The August 2012 FTA Circular 4701.3 cites USDOT Order 5610.2, issued in May 2012, to define adverse impacts. The topics comprising adverse impacts, ranging from community impacts to natural environment impacts, are analyzed in the RLE technical memoranda. Potentially adverse impacts are discussed in Section 5 of this report, as the entire project area consists of Environmental Justice communities. The circular also cites the USDOT order's definition of a disproportionately high and adverse effect on human health or the environment as one that would be predominantly borne by a minority population and/or a low-income population, or would be suffered by the minority population and/or low-income population and would be appreciably more severe or greater in magnitude than the adverse impact that would be suffered by the non-minority population and/or non-low-income population.

Disproportionately high and adverse effects would only be possible if the project area contained both Environmental Justice and non-Environmental Justice populations, and there would be unevenness in the level of impacts and benefits between the two. Because all of the populations that would benefit from and be affected by the project comprise predominantly minority and/or low-income persons, disproportionately high and adverse effects would not occur. Section 5 describes the analysis, which identified the adverse impacts that would occur in minority and low-income communities (i.e., all of the impacts of the alternatives, none of which would be disproportionately high and adverse), and addressed the concerns raised during the outreach process.

Identification of mitigation measures is required for any identified disproportionately high and adverse effects on Environmental Justice populations. Because no such impacts would result from any of the RLE alternatives, there is no requirement to identify mitigation measures beyond those presented in other RLE technical memoranda (and summarized in Section 5 of this report).

3.2.3 Receipt of Benefits

Similarly to the analysis of potentially adverse impacts described in Section 3.2.2, the RLE technical memoranda were also reviewed to identify the benefits of the project. Analysis was performed to verify that the benefits of the alternatives would be distributed evenly throughout the project area, and that they would accrue simultaneously to all of the adversely affected communities.

3.3 Area of Potential Impact

The area of potential impact (API) for analyzing permanent, construction, and cumulative impacts was established based on FTA Circular 4703.1 (August 2012), which recommends the following:

- Identifying the presence of district minority and/or low-income communities residing both within and in proximity to the project or activity.
- Identifying those minority and/or low-income groups that utilize or are dependent on natural resources and the human environment that could be potentially affected by the proposed action.

The API is also based on the findings of the other RLE technical memoranda relevant to Environmental Justice, most of which are focused within a one-block radius of the proposed alignments. Potential benefits of the project, such as improved transit access, would accrue to the larger catchment areas around the station locations, roughly ½ mile. The combined area of potential benefits and impacts covers most of the project area designated in the *Purpose and Need Report*.

Identification of Environmental Justice populations affected by the RLE Project was conducted pursuant to NEPA guidance (40 Code of Federal Regulations 1508) and FTA Circular 4703.1 (August 2012). For the purposes of locating minority communities, the API includes blocks/block groups within the project area defined in the Purpose and Need Statement. This API results in an area of approximately ½ mile around the proposed ROW for the each of the alternatives, with some modifications to account for key geographic features such as waterways and major streets. Impacts are reported based on the API assumed for each resource in its technical memorandum.

3.4 Methods

The FTA's Circular 4703.1 (August 2012) outlines a process of analyzing demographic data to identify the presence of Environmental Justice populations, identifying adverse effects that may be disproportionately high and adverse, evaluating benefits, and achieving meaningful public engagement in the decision-making process. The RLE Project incorporated the guiding principles of the circular through the following analytical and outreach steps:

- Demographic Analysis and Initial Community Outreach - Socioeconomic data from the 2010 Census and the American Community Survey were used to describe the population in the project area. Income, ethnicity, employment, age, housing characteristics, and English proficiency were used in conjunction with field observations and stakeholder interviews to help identify the presence of Environmental Justice populations. Results of the data analysis are provided in Section 4, and the LEP analysis is presented in Appendix A. The results show that the entire project area consists of predominantly minority populations, with some concentrations of low-income groups. Pockets of Spanish-speaking populations were also identified, indicating the need for outreach in both English and Spanish languages.

- Environmental Analysis to Identify Adverse Impacts and Benefits - All of the benefits and impacts of the projects would accrue to the same minority and low-income populations. As such, the RLE Project, as a community-initiated project intended to spur mobility and economic development in minority and low-income communities, would not have the potential for disproportionately high and adverse effects. The Environmental Justice-specific environmental analysis focused on identifying all adverse impacts and mitigations of the alternatives because they would all affect Environmental Justice populations. Benefits that offset the potential impacts were also identified and included in the analysis. Identification of additional mitigations specifically for Environmental Justice purposes would not be necessary for the RLE Project, because none of the effects would be disproportionately high and adverse. No additional mitigation measures—beyond those identified in the other RLE technical memoranda—would be needed to meet Environmental Justice requirements. Section 5 presents the results of the environmental analysis.

- Engagement with Environmental Justice Populations in the Public Outreach and Decision-Making Process - The stakeholder interview process and CTA's ongoing community relations efforts helped identify effective outreach methods. Traditional outreach methods such as public meetings and comment periods were augmented by non-traditional outreach. Non-traditional activities included website postings, presentations at standing meetings of local community groups, e-mail and direct mail newsletters, and one-on-one meetings with elected officials and community group leaders. Section 7 presents the results of the outreach process.

- Incorporation of Input from Environmental Justice Populations into the NEPA Process: - *To be filled in after outreach is completed.*

Section 4
Affected Environment

This section describes the low-income, minority, and LEP populations in the project area, which constitute the Environmental Justice populations for the purposes of this technical analysis. Elderly and disabled populations are also identified per state guidance. Demographic statistics were gathered at the most detailed level available from the U.S. Census Bureau for race, ethnicity, income, and age and were analyzed at the census block group level to define the Environmental Justice areas. Within the project area, all of the block groups were identified as Environmental Justice areas based on minority statues. Concentrations of block groups in the Roseland and Riverdale community areas were identified as Environmental Justice areas based on low-income as well as minority status. The Environmental Justice populations discussed in this report were identified through a combination of year 2010 U.S. Census data, American Community Survey data, public outreach, and field reconnaissance. Adverse impacts would be likely to occur within a ¼-mile radius of the project infrastructure, whereas beneficial impacts would accrue to a larger area of approximately ½ mile or more around the station locations. The area within ½ mile of station locations and within ¼ mile of the alternative alignments comprises the API for the Environmental Justice analysis. Census data is reported at the block group level. Based on field observation and research, these boundaries do not artificially dilute or inflate the affected minority population and/or low-income population findings, and allow for differentiation of impacts around the yard and shop locations versus those around the alternative alignments. The affected communities and concentrations of resources in the project area are shown in Figure 4-1 and Figure 4-2, respectively. The character of each community is described in greater detail in the *Neighborhood and Community Impacts Technical Memorandum*.

Figure 4-2: Concentrations of Community Resources

Key community resources include parks, schools, libraries, police facilities, fire department facilities, community centers, religious institutions, hospitals, and other places that serve as neighborhood focal points and contribute to community character and identity. The *Neighborhood and Community Impacts Technical Memorandum* provides additional detail on specific resources within ¼ mile of the proposed alignments.

4.1 Minority Groups

Minority persons include the following, as defined by the May 2012 USDOT Order 5610.2 and referenced in the August 2012 FTA Circular 4703.1:

- Black (a person having origins in any of the black racial groups of Africa).
- Hispanic (a person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race).
- Asian American (a person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands).
- American Indian and Alaskan Native (a person having origins in any of the original people of the Americas and who maintains cultural identification through tribal affiliation or community recognition).

This analysis defines a minority population as a population that meets one or both of the following descriptions:

- Any readily identifiable group of persons and/or a community who live in geographic proximity, and if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans), who experience common conditions of exposure or impact.
- A group consisting of persons classified by the U.S. Census Bureau as minority, including those persons of two or more races.

As shown in Table 4-1, the 2010 U.S. Census was used to identify minority populations in the project area as a whole and the specific affected communities in the API. Most of the populated portions of the project area contain predominantly minority populations; the project area population consists of 97.9 percent minority persons. In the API, the communities with the highest percentage of minority persons are Roseland and Riverdale, followed closely by Washington Heights, West Pullman, and Morgan Park. The community with the smallest percentage of minority persons in the API is Pullman, which still has a high minority percentage of 92.9 percent. Figure 4-3 identifies the percent minority populations in the project area at the census block level. The large blocks in the southeastern portion of the API have low populations.

Table 4-1: Percent of Population that is Minority

Figure 4-3: Minority Populations - Percentage

Source: U.S. Census Bureau, 2010 Census, Summary File 1, Table P5 - Hispanic or Latino Origin by Race, by Block

The racial composition of the project area is shown in Table 4-2. All communities in the project area have a majority Black or African American population, ranging from just above 89 percent in the Village of Calumet Park to approximately 97 percent in Roseland and Washington Heights. After Black or African American, the second largest ethnicity in the API is Hispanic at 4 percent. Of the communities in the API, Pullman has the highest percentage of Hispanic persons at 7.8 percent, followed by the Village of Calumet Park at 6.2 percent and West Pullman at 5.1 percent. Pullman also has the highest percentage of white persons at 7.1 percent, followed by the Village of Calumet Park at 3.6 percent.

Table 4-2: Racial Composition within the Area of Potential Impact as a Whole

Area	White Alone	Black or African-American Alone	American Indian/ Native Alaskan Alone	Asian Alone	Native Hawaiian and other Pacific Islander Alone	Some other Race Alone	Multiracial	Hispanic not Alone
City of Chicago	31.7%	32.4%	0.0%	5.4%	0.0%	0.0%	1.3%	28.9%
Project Area	2.1%	92.7%	0.2%	0.1%	0.0%	0.1%	1.0%	4.0%

Village of Calumet Park	3.6%	89.1%	0.1%	0.3%	0.0%	0.1%	0.6%	6.2%

Source: U.S. Census Bureau, 2010 Census, Summary File 1, Table P5 - Hispanic or Latino Origin by Race, by Block.
Note: Hispanic population includes persons who identify as white or some other race, or combination of races.

4.2 Low-Income Groups

The low-income classification applies to persons whose median household income is at or below the U.S. Department of Health and Human Services poverty guidelines (USDOT Order 5610.2(a), May 2012). Median household income data in the 2006–2010 American Community Survey is reported in 2010 dollars. In order to compare the 2012 poverty guidelines with data in 2010 dollars, the 2012 guidelines were adjusted to 2010 dollars using the Consumer Price Index Inflation Calculator used by the U.S. Department of Labor, Bureau of Labor Statistics (Table 4-3).

Table 4-3: U.S. Department of Health and Human Services 2012 Poverty Guideline

Persons in Household	2012 Poverty Guideline	Adjusted Poverty Guideline (2010 dollars)
1	$11,170	$10,586
2	$15,130	$14,339
3	$19,090	$18,092
4	$23,050	$21,845
5	$27,010	$25,598
6	$30,970	$29,351
7	$34,930	$33,104
8	$38,890	$36,857

Source: U.S. Department of Health and Human Services, 2012 http://aspe.hhs.gov/poverty/12poverty.shtml
United States Department of Labor, Bureau of Labor Statistics, 2012
http://www.bls.gov/data/inflation_calculator.htm

According to the 2006–2010 American Community Survey, the median household income in the project area was $41,710, which is less than the median household income ($46,877) for the City of Chicago (2006–2010 American Community Survey 5-Year Estimates). As shown in Table 4-4, the community with the lowest median household income in the API is Riverdale with $11,181, which is substantially lower than the median household income for the project area and the City of Chicago. The community with the highest median household income is the Village of Calumet ($53,785). Figure 4-4 shows median household income in the project area. The large blocks in the southeastern portion of the API have low populations.

Table 4-4: Median Household Income in Affected Communities

Area	Median Household Income
City of Chicago	$46,877
Project Area	$41,710
Affected Communities	
Washington Heights	$48,659
Roseland	$41,922
Morgan Park	$42,977
West Pullman	$38,963
Pullman	$43,647
Riverdale	$11,181
Village of Calumet Park	$53,785

Figure 4-4: Median Household Income

Source: U.S. Census Bureau, 2006-2010 American Community Survey, Table B19001 - Household Income in the Past 12 Months (in 2010 Inflation-Adjusted Dollars), by Block Group

According to the U.S. Department of Health and Human Services 2012 Poverty Guidelines (see Table 3-1), only ten block groups in the project area have populations with median household income below poverty guidelines. As shown in Table 4-5, seven of the ten block groups are in Riverdale, two are in West Pullman, and one is in Roseland. Two block groups in Riverdale have a very low median household income of $2,499, and both of them are in the Altgeld Gardens public housing complex. Figure 4-5 shows the low-income population at the census block group level. The shaded area in the southeastern portion of the API has minimal population between 115th and 130th Streets. The majority of the population in this shaded area is south of 130th Street. Table 4-5 shows that the seven low-income block groups in Riverdale make up the entire community area, illustrating the substantial presence of poverty in Riverdale. Low-income status was determined by comparing the median household income of each block group and the average household size for its census tract with the poverty guidelines shown in Table 4-3. Low income is also a transit dependency factor because residents with limited income may not be able to afford access to an automobile.

Table 4-5: Block Groups with Populations Below Poverty Level in the Area of Potential Impact

Community Area	Median Household Income	Average Household Size	Block Group
Riverdale	$11,859	2.68	Block Group 1, Census Tract 5401.01

Figure 4-5: Low-Income Block Groups

Sources: U.S. Census Bureau, 2006-2010 American Community Survey, Table B19001 - Household Income in the Past 12 Months (In 2010 Inflation-Adjusted Dollars), by Block Group;

U.S. Census Bureau, 2006-2010 American Community Survey, Table B25010 - Average Household Size of Occupied Housing Units by Tenure, by Census Tract.

As shown in Table 4-6, the unemployment rate for the entire project area is 19.0 percent. The unemployment rates for the individual community areas range from a low of 17.0 percent in Morgan Park to a high of 34.8 percent in Riverdale. Unemployment in the project area is generally higher than in the rest of the City of Chicago, which has an overall unemployment rate of 12.0 percent.

Table 4-6: Unemployment Rates in Affected Communities

Area	Unemployment Rate
City of Chicago	12.0%
Project Area	19.0%
Affected Communities	
Washington Heights	18.8%
Roseland	21.2%
Morgan Park	17.0%
West Pullman	18.5%
Pullman	21.4%
Riverdale	34.8%
Village of Calumet Park	17.4%

Source: U.S. Census Bureau, U.S. 2010 Census, 2011 ACS 5-year estimates, Table S2301, All Census Tracts within Cook County
Note: Data not available at block group level

According to the real estate website zillow.com, the median Chicago home price in October 2012 was approximately $161,100, and the median rent was $1,501. Home and rental prices in the project area neighborhoods are 20 to 50 percent lower than the citywide median (Table 4-7). Compared to Chicago as a whole, the project area has lower median household income and home prices, and higher unemployment in most RLE community areas (see Tables 4-4, 4-6, and 4-7).

Table 4-7: October 2012 Average Home and Rental Prices in Affected Communities

Area	Average Home Price	Average Monthly Rental Price
City of Chicago	$161,100	$1,501
Affected Communities		
Washington Heights	$112,300	$1,257
Roseland	$85,200	$1,232
Morgan Park	$113,500	$1,277
West Pullman	$92,700	$1,228
Pullman	$91,500	$1,213
Riverdale	N/A	N/A
Village of Calumet Park	$75,200	$1,219

Sources: zillow.com, Chicago Home Prices and Home Values in Illinois (October 2012b); zillow.com, Calumet Park Home Prices and Home Values in Illinois (October 2012a)

According to CMAP's *Red Line South Extension Livability Report* (CMAP and Developing Communities Project 2012), there is a shortage of jobs within the project area and a lack of transit access to jobs in neighboring communities. Distance to employment centers is greater in the project area than in many other parts of the city, so lack of convenient access to rail transit is a major barrier to employment. While there is CTA bus, Pace bus, and Metra rail service, there are limited options for connecting to the CTA rail system that ends at the 95th Street Terminal. There are also no stations with park & ride facilities along the Dan Ryan branch of the Red Line, which precludes residents from accessing the stations by car unless dropped off (kiss & ride). Residents often choose to use bus service instead of Metra service because Metra has a higher fare structure and more limited schedule than the bus system; however, only a limited number of buses provide 24-hour service. The *Red Line South Extension Livability Report* characterizes commute times in the project area as long and requiring multiple transfers. Traffic congestion, largely due to trip delays from at-grade freight railroad crossings, also impedes access to employment outside the project area.

4.3 Minority and Low-Income Groups

Figure 4-6 shows areas where low-income and minority populations overlap. These areas include the block groups that make up Altgeld Gardens, Golden Gate, and Eden Green in Riverdale; the majority of Block Group 2, Census Tract 5301 in West Pullman (east of Halsted Street and west of Stewart Avenue between 118th Street and 119th Street); the majority of Block Group 3, Census Tract 5302 in West Pullman (east of State Street and west of Prairie Avenue between 116th Street and 119th Street); and the majority of Block Group 2, Census Tract 4909.01 in Roseland (east of State Street and west of Michigan Avenue between 107th Street and 111th Street). The large blocks in the southeastern portion of the API have low populations.

As discussed above, there are limited transportation options for reaching to the Red Line's 95th Street Terminal from many project area communities. Nearly all of the identified low-income and minority areas are geographically and/or physically isolated from the 95th Street Terminal. The closest population (Block Group 2, Census Tract 4909.01 in Roseland) is 1.5 miles from the 95th Street Terminal; however, pedestrian access is impaired by the Interstate 94/Interstate 57 (I-94/I-57) interchange. Altgeld Gardens is approximately 6 miles from the 95th Street Terminal. In addition, bus service is limited and inconsistent. Only a limited number of buses provide 24-hour service. A section of CTA bus route #34 operates part-time between the Altgeld Gardens housing complex and the 95th Street Terminal.

4.4 Limited English Proficiency Groups

Limited English Proficiency (LEP) persons are defined as individuals for whom English is not their primary language and who have a limited ability to read, write, speak, or understand English. It includes people who reported to the U.S. Census Bureau that they speak English less than very well, not well, or not at all (Circular 4702.1B, October 2012).

The U.S. Census Bureau collects information about the ability of people to speak English and about those living in a linguistically isolated household. A linguistically isolated household is defined as one in which no member, 14 years of age or older, speaks only English or speaks a non-English language and speaks English very well. This definition means that all members of a linguistically isolated household 14 years old and over have at least some difficulty with English (U.S. Census Bureau).

According to the 2010 U.S. Census, English is the most spoken language at home in the project area, with 92.6 percent of households speaking English only. As shown in Table 4-8, Spanish is the second most spoken language at home, with over 6 percent of households speaking Spanish. The largest Spanish-speaking populations live in the Village of Calumet Park, where 15.5 percent of households speak Spanish. Pullman and West Pullman also have a large percentage of Spanish-speaking households with 10.4 percent and 6.7 percent of homes speaking Spanish, respectively. Specific census tracts in the West Pullman and South Deering neighborhoods and the Village of Calumet Park reported that over 30 percent of households speak Spanish.

A LEP assessment (Appendix A) was conducted for the project area in 2009. While the LEP assessment was based on year 2000 Census data, its findings remain consistent with current field observations and 2010 Census data. According to the LEP study, 1 percent of households within census tracts in the project area are linguistically isolated, meaning that all household members over the age of 14 had at least some difficulty speaking English.

Table 4-8: Languages Spoken at Home within the Affected Communities

Area	English Only	Spanish or Spanish Creole	Other Indo-European languages	Asian and Pacific Island languages	Other Languages
City of Chicago	64.7%	24.2%	6.4%	3.5%	1.3%
Project Area	92.6%	6.3%	0.6%	0.1%	0.4%
Affected Communities					
Washington Heights	97.0%	1.8%	0.2%	0%	1.1%
Roseland	98.5%	0.9%	0.5%	0.1%	0.1%
Morgan Park	95.7%	2.3%	1.5%	0.5%	0.1%
West Pullman	92.8%	6.7%	0.2%	0%	0.4%
Pullman	89.4%	10.4%	0.3%	0%	0%
Riverdale	96.2%	2.9%	0%	0.5%	0.5%
Village of Calumet Park	82.7%	15.5%	1.3%	0.1%	0.5%

Source: U.S. Census Bureau, 2010 American Community Survey 5-year estimates, Table S160, by Census Tract
Note: Data not available at block group level at the time of analysis

Figure 4-7 identifies the percentage of LEP populations in the project area. As illustrated in Figure 4-7, the highest percentages of LEP groups in the project area are in West Pullman, east of State Street between 115th Street and 119th Street; in Pullman east of the Metra Electric District line between 111th Street and 119th Street; and near Calumet Lake. The primary area where LEP populations are located is in West Pullman. The large tracts in the southeastern portion of the API have low populations. Due to the existence of LEP populations and because Spanish is the most frequently spoken non-English language in the project area, public outreach includes Spanish translation. The full LEP Assessment is attached as Appendix A.

Note: Data not available at block group level at the time of analysis

4.5 Elderly Groups

According to the 2010 U.S. Census, 13.7 percent of the population in the project area is elderly, defined as 65 years and older. As shown in Table 4-9, the areas with the highest percentages of elderly persons are Washington Heights (16.7 percent) and Morgan Park (16.3 percent). The lowest percentage of elderly persons is in Riverdale (2.8 percent). Figure 4-8 shows the percentages of persons that are elderly by block group. The block with the highest percentage of elderly persons is in West Pullman. The large blocks in the southeastern portion of the API have low populations. Elderly groups can have higher levels of transit dependency than the rest of the population because some elderly people are no longer able to operate automobiles.

There are several senior housing facilities throughout the project area. A representative list includes the following:

- Senior Suites of Washington Heights, 848 W. 103rd Street in Roseland
- Victory Centre of Roseland, 10450 S. Michigan Avenue in Roseland
- Emil Jones Jr. Senior Housing, 19 E. 110th Place in Roseland
- Roseland Manor, 11717 S. State Street in West Pullman
- Bridge of Hope Inc., 11909 S. State Street in West Pullman
- Calumet Township Senior Citizen, 12633 S. Ashland Avenue in the Village of Calumet Park
- Golden Community Living Center, 12730 Aberdeen Street in the Village of Calumet Park

4.6 People with Disabilities

According to the 2000 U.S. Census (data was not yet available for the 2010 U.S. Census), nearly one quarter of the population in the API (24.8 percent) is disabled. As shown in Table 4-10, 10.8 percent of the disabled population is male, and 14.0 percent is female.

Table 4-10: Percentage of Population with Disabilities within the Area of Potential Impact as a Whole

Area	Percentage of Population with Disabilities	Percent of Disabled Population that is Male	Percent of Disabled Population that is Female
Area of Potential Impact	24.8%	10.8%	14.0%

Source: U.S. Census Bureau, 2000 Census, Table P21- Disability Status by Sex, by Block Group

Limited transit access in the project area is of particular concern for seniors and people with disabilities. In addition, a lack of park & ride facilities precludes residents from accessing transit stops by car unless dropped off (kiss & ride), requiring seniors and people with disabilities to depend on others for transportation. People with disabilities can frequently be transit dependent if they have a disability that prevents them from driving. Figure 4-9 shows the percentages of populations with disabilities. The large blocks in the southeastern portion of the API have low populations.

Source: U.S. Census Bureau, 2000 Census, Table P21 - Disability Status by Sex, by Block Group

4.7 Identification of Environmental Justice Populations

The project area was evaluated in the above subsections using census tract and block group level data. Based on field observation and research, these geographic boundaries do not artificially dilute or inflate the affected minority population and/or low-income population findings. Every community area in the project area comprises mostly minority populations, ranging from Pullman with an 83.6 percent minority population to Roseland with a 97.3 percent minority population. The project area has an average median household income ($41,710 annually) that is lower than the citywide average ($46,877 annually) and has substantial pockets of low-income populations in community areas such as Riverdale ($11,181 annually). As such, the analyzed demographic data indicates that the entire project area and API are made up solely of Environmental Justice communities.

Section 5
Impacts and Mitigations

The August 2012 FTA Circular 4703.1 *Environmental Justice Policy Guidance for Federal Transit Administration* and subsequent FTA webinar presentations indicate that projects in areas consisting entirely of Environmental Justice populations do not necessarily preclude disproportionately high and adverse effect findings; however, the following characteristics are true of the project area and the alternatives:

- The entire project area is predominantly minority populations. No community in the project area contains less than 92.9 percent minority populations, and the project area as a whole contains 97.9 percent minority populations.
- All of the impacts and benefits of the alternatives would accrue to the same minority populations, and few project benefits would occur outside the project area.
- The purpose of this community-initiated project includes connecting disadvantaged communities to Chicago's major employment and activity centers in an effort to spur economic development and improve livability. The project would help remediate the geographic isolation and lack of employment and development opportunities that currently exist in the project area.

Given these findings, none of the alternatives would result in disproportionately high and adverse effects on Environmental Justice populations. Some alternatives would still have adverse impacts on Environmental Justice communities; however, these impacts would not be disproportionate. In some instances, impacts would remain adverse despite implementation of mitigation measures. To provide a complete picture of how the RLE Project would affect Environmental Justice populations, this section summarizes the adverse impacts that would occur in Environmental Justice communities and the associated candidate mitigation measures. The mitigation measures identified in this section are preliminary, and are intended for public review. They will be finalized during the Final EIS process, after the NEPA Preferred Alternative has been designated.

5.1 No Build Alternative

The No Build Alternative would not involve any new construction for the RLE Project. There would be no major service improvements or new transportation infrastructure beyond projects that are listed in CMAP's *GO TO 2040* plan and Transportation Improvement Program. The transit network within the project area would remain largely the same as it is now.

5.1.1 Permanent Impacts and Mitigations - No Build Alternative

The No Build Alternative would not have any adverse impacts within Environmental Justice communities. The communities in the project area are, however, currently underserved by the CTA rail system compared to many other parts of Chicago, and the No Build Alternative would lack the beneficial increase in economic development and livability that the build alternatives would provide.

5.1.2 Construction Impacts and Mitigations - No Build Alternative

No construction would occur as part of the No Build Alternative.

5.2 Bus Rapid Transit Alternative

In addition to the provisions of the No Build Alternative, the BRT Alternative would provide enhanced bus service and stops from the existing 95th Street Terminal southward along Michigan Avenue to Altgeld Gardens in the Riverdale community. Surface parking lots would be added at the 103rd Street and 111th Street stops, and three-story parking garages would be added at the Kensington Avenue and 130th Street stops to accommodate park & ride customers.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

5.2.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from carbon monoxide (CO), greenhouse gases (GHG), particulate matter smaller than 2.5 micrometers ($PM_{2.5}$), or mobile source air toxics (MSAT) emissions are anticipated.

- Hazardous Materials: Operating BRT service and park & ride facilities would not change the existing types of hazardous materials used, stored, or transported. There would be no adverse permanent impacts related to hazardous materials.

- Historic and Cultural Resources: Three resources near the BRT alignment have been identified as eligible for listing on the National Register of Historic Places (NRHP). No adverse effects on historic resources are anticipated to occur.

- Land Use and Economic Development: Although BRT can spur economic development, the BRT Alternative would lack exclusive ROW, station facilities, and other rail-like features that are typically needed to generate development interests. With just compensation per the Uniform Relocation and Real Property Assistance Act of 1970 (Uniform Act), the impact of displacements on surrounding commercial and residential land uses not be adverse, and associated economic development impacts would be beneficial. There would be no adverse permanent impacts on land use or on economic development.

- Neighborhood and Community Impacts: The BRT Alternative would be an overall beneficial change in the character and cohesion of the affected communities, but not to the same extent as the rail alternatives. The BRT Alternative would slightly shorten travel times for people who access community resources and activity centers near the stop locations by transit. This benefit would be minor because the BRT Alternative would lack rail-like features to further enhance bus service and attract new riders. No adverse impacts on community resources would occur. Impacts would be beneficial overall; no mitigation measures would be required.

- Energy: Based on the assumptions for vehicles needed for operation of the BRT Alternative, the amount of fuel consumed would not affect local or regional fuel availability, or require the development of new energy sources. No adverse impacts would occur.

- Geology and Soils: Operation of the BRT Alternative is not expected to affect the geology or soil resources in the project area.

- Cumulative: No adverse cumulative impacts are expected.

5.2.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: Impacts on vegetation at the 130th Street park & ride would not be adverse with compliance with local tree protection ordinances, including tree replacement. No other biological resources impacts would be adverse.

- Displacements: The BRT Alternative would require fewer permanent acquisitions and displacements than the other build alternatives. Three buildings would be displaced, of which one would be a single-family residence and one would be a commercial property. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse.

- Safety and Security: There would be no adverse permanent impacts resulting from the BRT Alternative with the inclusion of mitigation measures to enhance safety, which would include installation of new traffic signals and/or other pedestrian crossing treatments, and location of stops in Altgeld Gardens in visible and well-populated areas.

- Visual and Aesthetic Conditions: The implementation of the BRT Alternative overall would have minimal impact on the visual and aesthetic conditions in the project area other than the addition of a three-story parking garage at the Kensington Avenue stop and at the 130th Street stop. Mitigation to reduce visual impacts would include shielding exterior lighting and providing special consideration for lighting placement adjacent to sensitive areas such as residential communities; providing landscaping and/or visual screening at park & ride locations where possible; designing the parking structure to match the character of the surrounding fabric; and using urban design techniques to reduce massing. The permanent visual impacts would not be adverse after mitigation.

- Water Resources: There would be no adverse permanent impacts on groundwater. There would be no adverse permanent impacts on stormwater drainage or water quality after mitigation. Stormwater drainage mitigation measures would include incorporating new stormwater management structures and establishing an erosion control plan, particularly at the locations of garages and park & ride lots. Water quality mitigation measures would include installation of properly designed and maintained biological oil and grease removal systems; proper storage of hazardous materials, development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials, proper storage and maintenance of equipment, installation of detention basins to remove suspended solids, and regular monitoring of runoff water quality. Following compensatory mitigation, either through creation, restoration, enhancement, or preservation of wetlands, there would be no adverse permanent impacts on wetlands.

- Transportation: There would be seven intersections during the weekday AM peak and 10 intersections during the PM peak where the BRT Alternative would increase traffic congestion beyond applicable thresholds. Mitigation measures such as optimization of signal cycles, removal of segments of on-street parking near BRT stops, and restriping through lanes and turn lanes would render traffic conditions no worse than under the No Build Alternative. The alternative would not affect freight transportation or bicycle facilities. Adequate park & ride capacity would be provided at BRT stops to prevent spillover parking into surrounding neighborhoods. Beneficial pedestrian impacts would result from upgrading intersections with ADA-compliant curb ramps, replacing deteriorated sections of sidewalk, and improving bus shelters.

5.2.1.3 Topics with Adverse Permanent Impacts After Mitigation

- Noise and Vibration: Residential receptors, as well as 35 community facilities that are noise-sensitive receptors, would be subject to moderate noise impacts after mitigation. These noise impacts would not be mitigated, because noise barriers are not feasible along the route. Buses already operate along the proposed route, and the BRT Alternative would not substantially change the character of the existing noise. No disproportionate impacts due to noise and vibration are anticipated.

- Parklands and Community Facilities: The BRT Alternative would not pass through any parklands and would not displace any community facilities. There are 35 community facilities that are noise-sensitive receptors that would have moderate noise impacts after mitigation. These community facilities are already situated along major streets with buses under existing conditions. By improving travel time, BRT Alternative operation would improve access to parklands and community facilities within walking distance (½ mile) of the BRT stop locations when compared to the No Build Alternative. No disproportionate impacts on parklands and community facilities are anticipated.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

5.2.2.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the park & ride facilities, there would be no temporary displacement or relocation construction impacts.

- Historic and Cultural Resources: There would be no adverse construction effects on historic resources.

- Land Use and Economic Development: There would be no adverse construction impacts on land use or economic development.

- Noise and Vibration: Construction noise is expected to consist of parking structure construction and minor activity at the bus stop areas. Construction noise levels are not expected to exceed the FTA construction noise limits.

- Energy: Construction of the BRT Alternative is not expected to require an amount of fuel and other energy resources that would affect local or regional fuel and energy sources, or require the development of new sources.

- Geology and Soils: The BRT Alternative would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed at park & ride facilities, and is not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.2.2.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: Compared with the other build alternatives, construction activities for the BRT Alternative would be noticeably fewer and smaller in scale. Proper traffic management during the construction period would mitigate any potential adverse impacts. A Dust Control Plan would address in detail how dust would be controlled at all times at the construction sites, the staging areas, and the access and egress routes. With appropriate mitigation measures in place, no adverse air quality impacts due to construction activities are anticipated.

- Biological Resources: Compliance with local tree protection ordinances would result in less than adverse impacts on the human environment from tree removal. Mitigation measures may be required to reduce potential impacts on wildlife habitat, including preparing a detailed tree inventory, timing tree removal to occur outside the migratory bird nesting season, performing biological surveys if construction must occur during the nesting season, and replanting trees as required by applicable local codes and ordinances. There would be no adverse construction impacts on biological resources after mitigation.

- Hazardous Materials: Construction of the BRT Alternative would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. Contaminated materials potentially encountered could include heavy metals, asbestos-containing material, and lead-based paint. Mitigation measures would include compliance with federal, state, and local laws and regulations regarding hazardous materials; focused site assessments for areas where earthmoving activities would occur; asbestos, lead-based paint, and hazardous material surveys of building or structures; a Contaminated Material Management Plan; Health and Safety Plans for construction activities; Spill Prevention, Control, and Countermeasure Plans; and Construction Stormwater Pollution Prevention

Plans. There would be no adverse construction impacts relating to hazardous materials after mitigation.

- Neighborhood and Community Impacts: Impacts on the West Pullman community would not be adverse provided that best management practices are employed and nighttime construction near residences is limited to the extent practicable. Construction-related community impacts would be minimal for the 130th Street park & ride given the site's isolated location north of 130th Street. Construction of bus shelters, traffic signal control systems, and parking structures would be temporary, and could be scheduled so as not to conflict with community events. Construction impacts on community resources would not be adverse, and no mitigation measures would be required. Construction activities would not impede mobility to the extent that they would cause adverse impacts. The BRT Alternative would create temporary construction jobs, which could have a beneficial impact on community development; however, the employment increase would be greater for the rail alternatives. Impacts would not be adverse overall, and no mitigation measures would be required.

- Parklands and Community Facilities: Impacts on parklands and community facilities would include temporary air quality and noise impacts and temporary changes in access. Mitigation measures would include using construction best management practices, alerting park and community facility users of construction activities, providing safe and clearly marked detour routes, and designating alternate parking. There would be no adverse construction impacts on parklands or community facilities after mitigation.

- Safety and Security: The limited scope of work compared to other alternatives would minimize the risk of incidents resulting in fatalities, injuries, or criminal acts such as vandalism or theft on construction sites. To mitigate risks, contractors would be expected to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with any other manuals and policies. The contractor would take prompt and decisive corrective action on safety deficiencies identified at the work site. Access for emergency services would not be restricted, and the impacts would not be adverse.

- Visual and Aesthetic Conditions: At locations where park & ride structures and lots would be created, impacts might include construction fencing, demolition of existing buildings or clearing of vacant lots, temporary street closures and related signage, or temporary lighting or entrances. The CTA would attempt to maintain as much existing vegetation as practical during construction, and minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites. There would be no adverse construction impacts after mitigation.

- Water Resources: There would be no adverse construction impacts on water resources after mitigation. Stormwater drainage mitigation measures would include incorporating new stormwater management structures and establishing an erosion control plan, including for construction activities at the locations of garages and park & ride lots. Water quality mitigation measures would include installing properly designed and maintained biological oil and grease removal systems, proper storage of hazardous materials, development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials, proper storage and maintenance of equipment, periodic removal of landscape and construction debris, installation of detention basins to remove suspended solids, and regular monitoring of runoff water quality. Following compensatory mitigation, either through creation, restoration, enhancement, or preservation of wetlands, there would be no adverse permanent impacts on wetlands.

- Transportation: Construction of parking structures, park & ride lots, and bus shelters could result in temporary intermittent disruption of traffic, existing transit service, movement of freight vehicles, on-street parking availability, and pedestrian and bicycle circulation. Temporary lane and sidewalk closures would occur with detours provided to maintain access. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur.

5.2.2.3 Topics with Adverse Construction Impacts After Mitigation

No adverse construction impacts would remain after mitigation.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would involve an extension of the Red Line from its current terminus at the 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway medians and railroad corridors. The three options for the UPRR Rail Alternative are analyzed in two geographic segments:

- Segment UA: from the 95th Street Terminal to the Michigan Avenue station area, including the communities of Roseland, Washington Heights, and West Pullman

- Segment UB: south of the Michigan Avenue station area, in the Riverdale community

New stations would be constructed at 103rd Street on the boundary between the Roseland and Washington Heights communities, at 111th Street in Roseland, at Michigan Avenue in West Pullman, and at 130th Street in Riverdale. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots, but multi-level parking structures would be constructed at the Michigan Avenue and 130th Street stations.

The Chicago Department of Transportation is preparing the Far South Railroad Relocation Feasibility Study (FSRRFS). The study examines a possible project to move the existing freight operations out of the UPRR corridor, leaving the corridor vacant. The CTA would implement the ROW Option only if this separate project occurs prior to RLE. If the relocation project does not occur, then the CTA would need to choose either the East Option or West Option in order to pursue the UPRR Rail Alternative. Of the three options under consideration, the ROW Option would have the fewest adverse impacts. The East and West Options would have greater impacts due to the UPRR's requirement that the RLE tracks be located at least 50 feet from the active freight tracks, which would push the CTA elevated structure into the residential communities adjacent to the UPRR ROW.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1.1 Segment UA

5.3.1.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Historic and Cultural Resources: Six resources in Segment UA have been identified as eligible for listing on the NRHP. No adverse effects on historic resources are anticipated to occur.

- Noise and Vibration: Because of the reduction in noise level due to replacing the freight operations with the rail transit operations, noise mitigation would not be required. By using continuously welded rail, vibration levels would be below the FTA impact criterion, requiring no mitigation measures. No adverse noise or vibration impacts are anticipated.

- Energy: Energy consumption would increase due to the addition of new tracks and stations to the rail system; however, this increase in energy would not be adverse, as it is not expected to affect local or regional energy availability or require the development of new sources. Some beneficial reduction in fuel consumption would occur if the RLE Project were to cause motorists to begin using transit for some trips.

- Geology and Soils: Operation of the ROW Option would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.3.1.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: Of the UPRR Rail Alternative options, the ROW Option would have the least impact on existing vegetation. With compliance with local tree protection ordinances, potential impacts would not be adverse.

- Displacements: The ROW Option would have the fewest displacement impacts of the UPRR Rail Alternative options. In Segment UA, 20 buildings would need to be displaced, of which 2 would be commercial properties, 1 would be a multi-family residential property, and 15 would be single-family homes. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse.

- Hazardous Materials: Operation of ROW Option has the potential to result in the release of hazardous materials and/or petroleum products into the environment from accidental spills or from maintenance activities that require earthmoving in contaminated areas. Measures to avoid such occurrences would include adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures. There would be no adverse permanent impacts related to hazardous materials after mitigation.

- Land Use and Economic Development: The travel time savings for all UPRR Rail Alternative Options would support existing land uses and economic development. The park & ride lots at the 103rd Street, 111th Street, and Michigan Avenue stations, the substation just north of Michigan Avenue station, and the parking garage at the Michigan Avenue station would be inconsistent with adjacent land uses. These land uses consist of primarily single-family residential neighborhoods, with occasional commercial and apartment buildings. Mitigations include zoning variances, screening, landscaping, lighting appropriate for adjacent land uses, and appropriate architectural design and massing. Property displacements would be mitigated through just compensation and relocation assistance as required by the Uniform Act. There would be no adverse permanent impacts on land use following proposed mitigation measures. The overall impact on local economic development would be beneficial.

- Neighborhood and Community Impacts: Adverse visual character impacts on the community surrounding Wendell Smith Park could be avoided if the area beneath the elevated structure remained open for park use and new trees were planted to shield views of the elevated structure from homes fronting the park. If the potential UPRR relocation project being studied in the FSRRFS is implemented, it would be possible to allow for more crossing locations along the former freight ROW to enhance the connection between communities on both sides of the tracks. The 103rd Street and 111th Street stations would create transit hubs and would help revive the neighborhood with pedestrian activity. At the Michigan Avenue station, despite the concentration of residential displacements, the overall impacts of the station would be beneficial, and would contribute to a potential new activity center that could enhance the connection between the communities. There would be no adverse permanent neighborhood and community impacts after mitigation. The ROW Option would substantially reduce travel times between neighborhoods in the project area, and would enhance their connection with major job and activity centers to the north. The new transit service and the subsequent increase in pedestrian traffic could attract new businesses to the area and support the growth and enhancement of these neighborhood retail and service nodes. The station would serve as a transit hub that brings additional commuters and visitors to the area, which could further boost economic development. The result would be an overall increase in community livability. The mobility and development impacts of the ROW Option would be beneficial.

- Parklands and Community Facilities: The ROW Option alignment would pass through Wendell Smith Park but would not displace any community facilities; this impact would largely leave the functional and recreational use of the park intact and impacts would not be adverse after mitigation. By improving travel time, operation of the ROW Option would improve access to parklands and community facilities within walking distance (½ mile) of the station locations. The parking garage at the Michigan Avenue station would provide space for retail and community facilities, which would result in a benefit to the community overall.

- Safety and Security: The impact of the ROW Option would not be adverse with mitigation. A large volume of pedestrians would be expected to cross the major streets near the stations without positive traffic control. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments as applicable, resulting in no adverse permanent impacts after mitigation. Impacts on security at parking facilities would be mitigated by implementing open design and would not be adverse after mitigation. New train stations would be unlikely to have much, if any, impact on neighborhood crime. Suggested mitigation measures would be security surveillance cameras and sidewalk lighting along commercial streets within approximately one block of train station entrances.

- Visual and Aesthetic Conditions: Views near Michigan Avenue station and park & ride would substantially change due to the addition of a multi-story garage, but would not be adverse impacts after mitigation. Mitigation to reduce visual impacts would include shielding exterior lighting and providing special consideration for lighting placement adjacent to sensitive areas such as residential communities; providing landscaping and/or visual screening at park & ride locations where possible; designing the parking structure to match the character of the surrounding fabric; and using urban design techniques to reduce massing.

- Water Resources: There would be no adverse permanent impacts on groundwater. There are no wetlands in Segment UA. Pervious area is anticipated to decrease in some areas; the decrease in pervious area could be mitigated by incorporating new stormwater management structures and establishing an erosion control plan. Major underground pipes and structures could be affected by the ROW Option; stormwater drainage and water structures would need to be designed to accommodate the pump station and other underground utilities. The rail service would replace automobile trips; there would be an associated reduction in runoff contaminants that collect on streets. For this reason, the ROW Option is anticipated to have a minor but positive water quality impact. Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs in the API; therefore, any potential increases in contaminated surface water runoff would have no adverse impact on groundwater quality. There would be no adverse permanent impacts on stormwater after mitigation.

- Transportation: There would be four intersections in the AM peak and six intersections in the PM peak in Segment UA where the ROW Option would increase traffic congestion beyond applicable thresholds, largely due to cars accessing the park & ride facilities at stations. Mitigation measures such as optimization of signal cycles and removal of some on-street parking near stations would render traffic conditions no worse than under the No Build Alternative. The park & ride facilities may also draw some motorists away from nearby highways, thereby improving traffic flow for automobiles and freight trucks. It is assumed for the ROW Option that existing UPRR freight operations would be relocated away from the existing corridor as a separate project prior to RLE implementation. The ROW Option would therefore have no impact on freight rail operations. Existing bus routes would be adjusted to interface better with the RLE stations and service. New pedestrian and bicycle facilities would also be included near stations to provide safe access, which would improve transit connections. Transit access to the project area would substantially improve, particularly for low-income residents who do not have access to automobiles. The overall transportation impacts would be beneficial.

5.3.1.1.3 Topics with Adverse Permanent Impacts After Mitigation

No adverse impacts would remain after mitigation.

5.3.1.2 Segment UB

5.3.1.2.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Historic and Cultural Resources: One resource in Segment UB has been identified as eligible for listing on the NRHP. No adverse effects on historic resources are anticipated to occur.

- Neighborhood and Community Impacts: No communities or neighborhoods exist in Segment UB north of 130th Street, because the area is industrial. As such, there would be no impacts north of 130th Street. Impacts from the South Station Option and West Station Option would be beneficial overall. The RLE would allow residents to easily access community resources in other neighborhoods, and perhaps serve as a focal point for the development of additional community resources in Riverdale. The UPRR Rail Alternative would substantially reduce travel times between the Washington Heights, Roseland, West Pullman, and Riverdale communities, and would enhance their connection with major job and activity centers north of the project area. The UPRR Rail Alternative would improve transit accessibility and provide residents with fast, reliable transit service to job centers to the north and areas where more services are available. Riverdale residents who do have automobiles would also benefit from having a new transit alternative to driving.

- Noise and Vibration: The alignment in Segment UB would be located primarily in vacant and industrial areas, which do not contain noise-sensitive land uses. Some residences are present near the Michigan Avenue and 130th Street station areas. By using continuously welded rail, vibration levels would be below the FTA impact criterion, requiring no mitigation measures. No adverse noise or vibration impacts are anticipated.

- Parklands and Community Facilities: The ROW Option alignment would not pass through any parkland and would not displace any community facilities in Segment UB. By improving travel time, operations in Segment UB would improve access to parklands and community facilities within walking distance (½ mile) of the station location when compared to the No Build Alternative. No adverse impacts on parklands or community facilities are anticipated.

- Energy: Compared to existing conditions, energy consumption would increase due to the addition of new tracks and stations to the rail system; however, this increase in energy would not be adverse, as it is not expected to affect local or regional energy availability, or require the development of new sources. Some beneficial reduction in fuel consumption would occur if the RLE Project were to cause motorists to begin using transit for some trips.

- Geology and Soils: Operation of the ROW Option would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.3.1.2.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: Some removal of vegetation would be needed. Given the non-mature forest cover and the surrounding industrial land uses, impacts on biological resources would not be adverse with compliance with local tree protection ordinances.

- Displacements: One non-residential building would be displaced. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area.

- Hazardous Materials: Given the proximity of Segment UB to an adjacent active railroad, there is the potential for impacts due to releases of hazardous materials potentially being transported and from hazardous materials used in the routine operation and maintenance of the railroad. These materials potentially exist along the railroad currently, but the UPRR Rail Alternative would bring transit vehicles closer to them. Measures to avoid such occurrences would include adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures. There would be no adverse permanent impacts related to hazardous materials after mitigation.

- Land Use and Economic Development: The limited impact of displacements on project area land use in Segment UB would not be adverse, and associated economic development impacts would be beneficial. Facilities would be designed to be compatible with surrounding uses, which are primarily industrial and include some residences near the 130th Street station location. Due to improved access for residents, commuters, employees, and visitors, the overall land use and economic development impacts would be beneficial.

- Safety and Security: The impact on major incidents would not be adverse. For potential impacts on pedestrian safety at the 130th Street station, a traffic signal, sidewalks, curb ramps, and marked crosswalks are included in the design, so there would be no adverse impact given these improvements. Impacts on security at parking facilities would be mitigated by implementing open design and would not be adverse after mitigation. Because the 130th Street station would not be centered in a neighborhood, the impacts on neighborhood security would not be adverse. Overall safety and security impacts would not be adverse after mitigation.

- Visual and Aesthetic Conditions: Permanent visual impacts would not be adverse after mitigation. Minimal visual changes would occur, and would mostly pertain to the addition of a multi-story parking structure at the 130th Street station. Mitigations to reduce visual impacts would include shielding exterior lighting and providing special consideration for lighting placement adjacent to sensitive areas such as residential communities; providing landscaping and/or visual screening at park & ride locations where possible; designing the parking structure to match the character of the surrounding fabric; and using urban design techniques to reduce massing.

- Water Resources: Pervious area is anticipated to decrease in some areas; the decrease in pervious area could be mitigated by incorporating new stormwater management structures and establishing an erosion control plan. The RLE Project would replace automobile trips; there would be an associated reduction in runoff contaminants that collect on streets. For this reason, the alternative is anticipated to have a minor but positive water quality impact. Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs in the API. There would be no adverse permanent impacts on groundwater quality. There would be no permanent adverse impacts on stormwater drainage, water quality, or wetlands.

- Transportation: There would be seven intersections in the AM peak and nine intersections in the PM peak in Segment UB where the ROW Option would increase traffic congestion beyond applicable thresholds, largely due to cars accessing the park & ride facilities at stations. Mitigation measures such as optimization of signal cycles, adding turn lanes, restricting turns at some intersections, and restriping existing lanes would render traffic conditions no worse than under the No Build Alternative. The park & ride facilities may also draw some motorists away from nearby highways, thereby improving traffic flow for automobiles and freight trucks. The UPRR Rail Alternative would not affect Canadian National and Indiana Harbor Belt operations, and would therefore have no impact on freight rail. Existing bus routes would be adjusted to interface better with the RLE stations and service. New pedestrian and bicycle facilities would also be included near stations to provide safe access, which would improve transit connections. Transit access to the project area would substantially improve, particularly for low-income residents who do not have access to automobiles. The overall transportation impacts would be beneficial.

5.3.1.2.3 Topics with Adverse Permanent Impacts After Mitigation
No adverse impacts would remain after mitigation.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.2.1 Segment UA

5.3.2.1.1 Topics with No Adverse Construction Impacts
- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Historic and Cultural Resources: There would be no adverse construction effects on historic resources.

- Noise and Vibration: Based on the types of construction equipment and activities identified in the *Description of Construction and Phasing for Environmental Impact Statement Build Alternatives* (Description of Construction), construction noise levels are not expected to exceed the FTA construction noise limits.

- Energy: The construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: The ROW Option would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed for the elevated structure supports, at-grade trackbeds, and park & ride facilities. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.3.2.1.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Proper traffic management during the construction period would mitigate any potential adverse effects. A Dust Control Plan would address in detail how dust would be controlled at all times at the construction site, the staging areas, and the access and egress routes.

- Biological Resources: There would be no adverse construction impacts on biological resources after mitigation. Compliance with local tree protection ordinances would mitigate the impacts of tree removal. As needed, mitigation measures to reduce potential impacts on wildlife habitat would be performed, including preparing a detailed tree inventory, timing tree removal to occur outside the migratory bird nesting season, performing biological surveys if construction must occur during the nesting season, and replanting trees as required by applicable local codes and ordinances.

- Hazardous Materials: There would be no adverse construction impacts relating to hazardous materials after mitigation. Construction would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. Contaminated materials potentially encountered could include heavy metals, asbestos-containing material, and lead-based paint. Mitigation measures would include compliance with federal, state, and local laws and regulations regarding hazardous materials; focused site assessments for areas where earthmoving activities would occur; hazardous materials surveys of buildings; a Contaminated Material Management Plan; Health and Safety Plans for construction activities; Spill Prevention, Control, and Countermeasure Plans; and Construction Stormwater Pollution Prevention Plans.

- Land Use and Economic Development: Construction would take up to 3 years and would cause temporary impacts on adjacent residential neighborhoods due to noise, vibration, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include focusing construction activities primarily during the least impactful times of day and other best management practices. There would be short-term beneficial economic impacts from construction jobs. The land use impacts from construction would not be adverse after mitigation. The overall economic development impact from construction would be beneficial.

- Neighborhood and Community Impacts: Community disruption would occur while construction activities are performed for the UPRR Rail Alternative, with intensive construction occurring over a period of approximately 3 years. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. Temporary dust, noise, and visual impacts would occur. Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Businesses around the alignment and parking structure could be affected by construction activities, construction-related traffic, and road and sidewalk closures. This potentially adverse impact would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses during construction.

- Parklands and Community Facilities: Construction activities would occur in Wendell Smith Park and would temporarily affect this park. The elevated structure would pass through the northwest corner of the park property. The temporary inaccessibility of part of the park would not adversely affect park function, and impacts would be mitigated through best management practices and coordination with community members and the Chicago Park District. Construction activities would generate temporary noise and air quality impacts, and/or change access to or parking around the parks. These impacts would be temporary in nature and would be mitigated through the use of construction best management practices; by alerting parkland users of construction activities; and by providing clearly marked detour routes and alternate parking. Coordination with the Chicago Park District would result in options to mitigate impacts on any of the organized park activities; for example, the recreational activities could be temporarily relocated to a nearby park while construction was underway. After mitigation, construction of the ROW Option would not adversely affect the parks in Segment UA. Construction of the ROW Option would temporarily affect New Christian Joy Missionary Baptist Church because it is adjacent to the proposed ROW. After mitigations similar to those for parks, this church would not have adverse impacts.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site would not be adverse after mitigation, which would include minimizing detour lengths.

- Visual and Aesthetic Conditions: The visual impacts related to construction would not be adverse after mitigation. At locations where park & ride structures and lots would be created, impacts would include construction fencing, demolition of existing buildings or clearing of vacant lots, temporary street closures and related signage, or temporary lighting or entrances. The CTA would attempt to maintain as much existing vegetation as practical during construction, and would minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites.

- Water Resources: There would be no adverse construction impacts on drainage, groundwater, or water quality after mitigation. There would be no adverse construction impacts on water resources after mitigation. Stormwater drainage mitigation measures would include incorporating new stormwater management structures and establishing an erosion control plan, including for construction activities at the locations of garages and park & ride lots. Water quality mitigation measures would include installing properly designed and maintained biological oil and grease removal systems, proper storage of hazardous materials, development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials, proper storage and maintenance of equipment, periodic removal of landscape and construction debris, installation of detention basins to remove suspended solids, and regular monitoring of runoff water quality. Care would need to be taken during construction in the vicinity of the Roseland Pump Station at 104th Street, as well as other underground utilities identified, in order to not damage existing structures. There are no wetlands in Segment UA.

- Transportation: Construction of rail facilities, parking structures, and park & ride lots would require lane and sidewalk closures that would temporarily reduce roadway capacity. These closures may lead to temporarily increased travel times for both motorists and transit riders, and bus stop locations may be temporarily relocated. Bicycles and pedestrians would need to be rerouted around work areas. Detours would be provided to maintain access. Lanes on I-57 may also need to be temporarily closed to accommodate rail construction in the median, which would affect automobiles and freight trucks. Temporary closure of full sections of I-57 may also be needed. Closures would be scheduled during low-traffic periods to the extent feasible to minimize impacts. It is assumed for the ROW Option that existing UPRR freight operations would be relocated away from the existing corridor as part of a separate project prior to RLE implementation. The ROW Option construction would therefore have no impact on freight rail operations. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.3.2.1.3 Topics with Adverse Construction Impacts After Mitigation

No adverse impacts would remain after mitigation.

5.3.2.2 Segment UB

5.3.2.2.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation impacts associated solely with the construction phase.

- Historic and Cultural Resources: There would be no adverse construction effects on historic resources.

- Noise and Vibration: Based on the types of construction equipment and activities identified in the Description of Construction, construction noise levels are not expected to exceed the FTA construction noise limits.

- Energy: The construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: The ROW Option would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed for the elevated structure supports, at-grade trackbeds, and park & ride facilities. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.3.2.2.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Proper traffic management during the construction period would mitigate any potential adverse effects. A Dust Control Plan would address in detail how dust would be controlled at all times at the construction site, the staging areas, and the access and egress routes.

- Biological Resources: There would be no adverse construction impacts on biological resources after mitigation. Compliance with local tree protection ordinances would mitigate the impacts of tree removal. As needed, mitigation measures to reduce potential impacts on wildlife habitat would be performed, including preparing a detailed tree inventory, timing tree removal to occur outside the migratory bird nesting season, performing biological surveys if construction must occur during the nesting season, and replanting trees as required by applicable local codes and ordinances.

- Hazardous Materials: There would be no adverse construction impacts relating to hazardous materials after mitigation. Construction would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. Contaminated materials potentially encountered could include heavy metals, asbestos-containing material, and lead-based paint. Mitigation measures would include compliance with federal, state, and local laws and regulations regarding hazardous materials; focused site assessments for areas where earthmoving activities would occur; hazardous materials surveys of buildings; a Contaminated Material Management Plan; Health and Safety Plans for construction activities; Spill Prevention, Control, and Countermeasure Plans; and Construction Stormwater Pollution Prevention Plans.

- Land Use and Economic Development: Construction would take up to 3 years and would cause temporary impacts on adjacent residential neighborhoods due to noise, vibration, fugitive dust, truck traffic, and roadway detours. Mitigation methods would include focusing construction activities primarily during the least impactful times of day and other best management practices. There would be short-term beneficial economic impacts from construction jobs. The land use impacts from construction would not be adverse after mitigation. The overall economic development impact from construction would be beneficial.

- Neighborhood and Community Impacts: Impacts on the Riverdale community would not be adverse provided that best management practices were employed and nighttime construction near residences was limited to the extent practicable. Community disruption would occur during construction activities for the UPRR Rail Alternative, with intensive construction occurring over a period of approximately 3 years. Overall there are few residences and businesses along Segment UB north of 130th Street. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. Temporary dust, noise, and visual impacts would occur. Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. This potentially adverse impact would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses during construction.

- Parklands and Community Facilities: No parklands would be displaced in Segment UB. Aldridge Elementary School is near the 130th Street West Station Option site and would have impacts associated with construction activities. The adverse impacts would be mitigated using construction best management practices, clearly marked detour routes, and notification to the school regarding the construction schedule.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site, would not be adverse after mitigation, which would include minimizing detour lengths.

- Visual and Aesthetic Conditions: At locations where park & ride structures and lots would be created, impacts might include construction fencing, demolition of existing buildings or clearing of vacant lots, temporary street closures and related signage, or temporary lighting or entrances. The CTA would attempt to maintain as much existing vegetation as practical during construction, and minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites. There would be no adverse construction impacts after mitigation.

- Water Resources: There would be no adverse construction impacts on water resources after mitigation. Stormwater drainage mitigation measures would include incorporating new stormwater management structures and establishing an erosion control plan, including for construction activities at the locations of garages and park & ride lots. Water quality mitigation measures would include installing properly designed and maintained biological oil and grease removal systems, proper storage of hazardous materials, development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials, proper storage and maintenance of equipment, periodic removal of landscape and construction debris, installation of detention basins to remove suspended solids, and regular monitoring of runoff water quality. After compensatory mitigation, either through creation, restoration, enhancement, or preservation of wetlands, there would be no adverse permanent impacts on wetlands.

- Transportation: Construction of rail facilities, parking structures, and park & ride lots would require lane and sidewalk closures that would temporarily reduce roadway capacity. These closures may lead to temporarily increased travel times for both motorists and transit riders, and bus stop locations may be temporarily relocated. Bicycles and pedestrians would need to be rerouted around work areas. Detours would be provided to maintain access, and closures would be scheduled during low-traffic periods to the extent feasible to minimize impacts. Construction would also be phased to minimize disruption to passenger and freight rail services. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.3.2.2.3 Topics with Adverse Construction Impacts After Mitigation

No adverse impacts would remain after mitigation.

5.3.3 120th Street Yard and Shop

5.3.3.1 Permanent Impacts and Mitigations

5.3.3.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Historic and Cultural Resources: No properties identified as eligible for listing on the NRHP lie in the vicinity of the yard and shop location; therefore, no effects are anticipated.

- Neighborhood and Community Impacts: The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. As such, no community impacts would result from operation of the facility.

- Noise and Vibration: Because there are no sensitive receptors in the vicinity of the 120th Street yard and shop, and because of the much lower amount of train activity in and out of the facility and the lower train speeds compared to other parts of the project corridor, the noise levels generated in this area would be substantially lower than the noise levels generated along other parts of the project corridor. As a result, the noise generated at the 120th Street yard and shop would not exceed the FTA impact criteria at the nearest sensitive receptors.

- Parklands and Community Facilities: There are no parklands or community facilities in, adjacent to, or within 500 feet of the proposed ROW for the 120th Street yard and shop. As such, there would be no impacts on parklands or community facilities as a result of the operation and/or construction of the 120th Street yard and shop.

- Transportation: Under the ROW Option, there would be no permanent impacts on bicycle or pedestrians, because the existing site is a combination of industrial and vacant land. Pedestrian access by the general public would be restricted and discouraged. Because of the location of the yard, no public transportation or parking facilities would be affected by this alternative. Some parking would be provided for yard employees.

- Energy: Yard and shop operation would require additional fuel and energy resources, but not to the extent that it would affect local or regional fuel and energy availability, or require development of new energy sources. As such, no adverse impacts would occur.

- Geology and Soils: Operation of the 120th Street yard and shop would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.3.3.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: Given the non-mature forest cover and the surrounding industrial land uses, impacts on biological resources would not be adverse with compliance with local tree protection ordinances.

- Displacements: The permanent envelope for the yard and shop would displace three buildings within the Riverdale neighborhood, of which none contain residences or commercial businesses. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area.

- Hazardous Materials: There would be no adverse permanent impacts related to hazardous materials after mitigation. Operation of yard and shop would have the potential to result in the release of hazardous materials and/or petroleum products into the environment from accidental spills or from maintenance activities that require earthmoving in contaminated areas. Measures to avoid such occurrences would include adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures.

- Land Use and Economic Development: The yard and shop would be located within an industrial area; the facilities would be designed to be consistent with existing land uses. The land use and economic impacts would not be adverse.

- Safety and Security: Impacts on security at the 120th Street yard and shop would not be adverse after mitigation. Mitigation measures would include complying with relevant design standards to minimize intrusion and prevent graffiti.

- Visual and Aesthetic Conditions: Due to the location in a low-density light industrial area, impacts would be minimal. Additional measures for the 120th Street yard and shop would include designing the shop facility structure to be aesthetically compatible with surrounding uses and screening the yard through fencing, walls, or vegetation wherever necessary and possible.

- Water Resources: There would be no adverse permanent impacts on groundwater. There would be no adverse permanent impacts on stormwater drainage or water quality associated with the 120th Street yard and shop after mitigation. Pervious area is anticipated to decrease in some areas; the decrease in pervious area could be mitigated by incorporating new stormwater management structures and establishing an erosion control plan. The introduction of new impervious surfaces would have the potential to increase the concentration and accumulation of runoff contaminants. Following compensatory mitigation, there would be no adverse permanent impacts on wetlands.

5.3.3.1.3 Topics with Adverse Permanent Impacts After Mitigation

No adverse impacts would remain after mitigation.

5.3.3.2 Construction Impacts and Mitigations

5.3.3.2.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Historic and Cultural Resources: No properties identified as eligible for listing on the NRHP lie in the vicinity of the yard and shop location; therefore, no effects are anticipated.

- Land Use and Economic Development: Because the yard and shop would be located in a heavy industrial area, the construction activities would not be adverse for land use or economic development.

- Neighborhood and Community Impacts: The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. Construction activities would be far enough from established communities that no impacts would occur.

- Noise and Vibration: Based on the construction activities and equipment identified in the Description of Construction, and with noise-reducing construction practices, construction noise levels are not expected to exceed the FTA construction noise limits. No sensitive receptors are near the yard and shop site.

- Parklands and Community Facilities: There are no parklands or community facilities in, adjacent to, or within 500 feet of the proposed ROW for the 120th Street yard and shop. As such, there would be no impacts on parklands or community facilities as a result of the operation and/or construction of the 120th Street yard and shop.

- Energy: Yard and shop construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: Construction of the 120th Street yard and shop would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the site. Excavation would be primarily needed for the at-grade trackbeds and shop buildings. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.3.3.2.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Proper traffic management during the construction period would mitigate any potential adverse effects. A Dust Control Plan would address in detail how dust would be controlled at all times at the construction site, the staging areas, and the access and egress routes.

- Biological Resources: There would be no adverse construction impacts on biological resources after mitigation. Compliance with local tree protection ordinances would mitigate the impacts of tree removal. As needed, mitigation measures to reduce potential impacts on wildlife habitat would be performed, including preparing a detailed tree inventory, timing tree removal to occur outside the migratory bird nesting season, performing biological surveys if construction must occur during the nesting season, and replanting trees as required by applicable local codes and ordinances.

- Hazardous Materials: There would be no adverse construction impacts relating to hazardous materials after mitigation. Construction would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. Contaminated materials potentially encountered could include heavy metals, asbestos-containing material, and lead-based paint. Mitigation measures would include compliance with federal, state, and local laws and regulations regarding hazardous materials; focused site assessments for areas where earthmoving activities would occur; hazardous materials surveys of buildings; a Contaminated Material Management Plan; Health and Safety Plans for construction activities; Spill Prevention, Control, and Countermeasure Plans; and Construction Stormwater Pollution Prevention Plans.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site, would not be adverse after mitigation, which would include minimizing detour lengths.

- Visual and Aesthetic Conditions: Construction impacts would be minor and not adverse after mitigation for the 120th Street yard and shop, due to its location in a low-density area and the nature of at-grade construction. Impacts might include construction fencing, demolition of existing buildings or clearing of vacant lots, temporary street closures and related signage, or temporary lighting or entrances. The CTA would attempt to maintain as much existing vegetation as practical during construction, and minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites.

- Water Resources: There would be no adverse construction impacts on water resources in the vicinity of the 120th Street yard and shop after mitigation. Stormwater drainage mitigation measures would include incorporating new stormwater management structures and establishing an erosion control plan. Water quality mitigation measures would include installing properly designed and maintained biological oil and grease removal systems, proper storage of hazardous materials, development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials, proper storage and maintenance of equipment, periodic removal of landscape and construction debris, installation of detention basins to remove suspended solids, and regular monitoring of runoff water quality.

- Transportation: During new track roadbed construction for the 120th Street yard and shop and the new access road for the existing Metropolitan Water Reclamation District facility, construction over and adjacent to the Northern Indiana Commuter Transit District/Chicago South Shore & South Bend Railroad would occur. During these construction activities, flagging operations and scheduled track closures would occur. Construction would be phased to minimize impacts on operations of the Metropolitan Water Reclamation District and Northern Indiana Commuter Transit District/Chicago South Shore & South Bend Railroad.

5.3.3.2.3 Topics with Adverse Construction Impacts After Mitigation

No adverse impacts would remain after mitigation.

5.4 Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative East Option would involve an extension of the Red Line from its current terminus at the 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway medians and railroad corridors. The three options for the UPRR Rail Alternative are analyzed in two geographic segments, as described above in Section 5.3 for the ROW Option. The East Option alignment would run along the eastern side of the UPRR ROW in Segment UA. The alignment in Segment UB is the same for all three options.

New stations would be constructed at 103rd Street on the boundary between the Roseland and Washington Heights communities, at 111th Street in Roseland, at Michigan Avenue in West Pullman, and at 130th Street in Riverdale. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots, but multi-level parking structures would be constructed at the Michigan Avenue and 130th Street stations. To ensure analysis of the maximum foreseeable impacts, it is assumed for the East and West Options that the possible project being studied in the FSRRFS would not have occurred prior to RLE construction and UPRR would continue freight operations in its existing ROW. Compared to the ROW Option, the East and West Options would have greater impacts due to the UPRR's requirement that the CTA tracks be located at least 50 feet from the active freight tracks. Particularly for the East Option, which would have the greatest number of building displacements, this requirement would push the elevated structure into the residential communities adjacent to the UPRR ROW.

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.1.1 Segment UA

5.4.1.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Historic and Cultural Resources: Six resources in Segment UA have been identified as eligible for listing on the NRHP. No adverse effects on historic resources are anticipated to occur as a result of the East Option.

- Energy: Energy consumption would increase due to the addition of new tracks and stations to the rail system; however, this increase in energy would not be adverse, as it is not expected to affect local or regional energy availability or require the development of new sources. Some beneficial reduction in fuel consumption would occur if the RLE Project were to cause motorists to begin using transit for some trips.

- Geology and Soils: Operation of the East Option would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.4.1.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: The East Option would affect a larger amount of vegetation than the ROW Option. With compliance with local tree protection ordinances, potential impacts would not be adverse.

- Displacements: The East Option would have the most impacts of the UPRR Rail Alternative options. In Segment UA, 107 buildings would be displaced, of which 81 would be single-family residences, 13 would be multi-family buildings, 3 would be commercial structures, and 1 would be a place of worship. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area.

- Hazardous Materials: Given the proximity of the UPRR track to the alignment for the East Option, there would be the potential for impacts due to releases of hazardous materials being transported and from hazardous materials used in the routine operation and maintenance of the UPRR. These materials potentially exist along the railroad currently, but the UPRR Rail Alternative would bring transit vehicles closer to them. There would be no adverse permanent impacts related to hazardous materials after mitigation. The impacts and mitigation measures would be similar to those for the ROW Option, as discussed above in Section 5.3.1.1.

- Land Use and Economic Development: The park & ride lots at the 103rd Street and 111th Street stations, and the parking garage at the Michigan Avenue station would be inconsistent with adjacent land uses due to the primarily residential and commercial nature of the areas around the proposed stations. These land uses consist of primarily single-family residential neighborhoods, with occasional commercial and apartment buildings. There would be no adverse permanent impacts on land use after proposed mitigation measures, as there could be new development spurred by the new station. The overall impact on local economic development would be beneficial. These impacts and mitigation measures would be similar to those for the ROW Option, as discussed above in Section 5.3.1.1.

- Noise and Vibration: There would be a substantial number of affected receptors where the train speeds reach 55 mph. Noise-affected residential receptors along the project corridor would require mitigation. A 3- to 4-foot-high noise barrier installed along the outer tracks of the aerial structure would reduce the wheel/rail noise that would propagate into the surrounding community. There would be no adverse noise impacts after mitigation. No adverse vibration impacts are anticipated.

- Parklands and Community Facilities: In segment UA, the East Option alignment would pass through the corner of Wendell Smith Park and the western portion of Block Park, and would displace Now Faith Church of God Holiness. The church could be relocated within the neighborhood. The East Option would largely leave the functional and recreational use of the parks intact and impacts would not be adverse after mitigation. By improving travel time, operation of the East Option would improve access to parklands and community facilities within walking distance (½ mile) of the station locations. The parking garage at the Michigan Avenue station would provide space for retail and community facilities; this space would result in a benefit to the community overall.

- Safety and Security: The impact on major incidents would not be adverse. A large volume of pedestrians would be expected to cross the major streets near the stations without positive traffic control. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments, resulting in no adverse permanent impacts after mitigation. Traffic signals would need to be interconnected with the railroad crossing warning devices. Impacts on security at parking facilities would be mitigated by implementing open design and would not be adverse after mitigation. New train stations would be unlikely to have much, if any, impact on neighborhood crime. Suggested mitigation measures would be security surveillance cameras and sidewalk lighting along commercial streets within approximately one block of train station entrances. Impacts on neighborhood security would not be adverse after mitigation. Overall safety and security impacts would not be adverse after mitigation. The East Option would directly increase the number of vehicles (mostly buses) and pedestrians crossing the UPRR tracks at 103rd Street and 111th Street compared to the No Build Alternative, and could indirectly induce land development that would further increase traffic volumes. The risk of vehicle crashes would be mitigated by installing safety protection technologies for vehicles and pedestrians. Given that transit passengers are often in a hurry, and given the likely delays to pedestrians due to the expected increase in freight volumes over existing conditions, it is reasonable to assume that some pedestrians may choose to take unacceptable safety risks by crossing the tracks while the signals are flashing. This adverse impact could be mitigated by incorporating a grade separation structure or providing pedestrian crossing gates at sidewalks.

- Water Resources: The East Option alignment would be closer to the Roseland Pump Station than the ROW Option alignment; consequently, it would be more complex from a drainage standpoint. There would be no adverse permanent impacts on water resources in Segment UA of the East Option. The impacts and mitigation measures would be similar to those for the ROW Option, described above in Section 5.3.1.1.2.

- Transportation: There would be four intersections in the AM peak and six intersections in the PM peak in Segment UA where the East Option would increase traffic congestion beyond applicable thresholds, largely due to cars accessing the park & ride facilities at stations. Mitigation measures such as optimization of signal cycles and removal of some on-street parking near stations would render traffic conditions no worse than under the No Build Alternative. The park & ride facilities may also draw some motorists away from nearby highways, thereby improving traffic flow for automobiles and freight trucks. The East Option would therefore have no impact on freight rail operations, because the rail line would be elevated above the UPRR ROW and no new grade crossings would be added. Existing bus routes would be adjusted to interface better with the RLE stations and service. New pedestrian and bicycle facilities would also be included near stations to provide safe access, including across the existing freight tracks, which would improve transit connections. Transit access to the project area would substantially improve, particularly for low-income residents who do not have access to automobiles. The overall transportation impacts would be beneficial.

5.4.1.1.3 Topics with Adverse Permanent Impacts After Mitigation

- Visual and Aesthetic Conditions: The elevated structure would cause adverse visual impacts at 117th Street and Prairie Avenue. Mitigation measures would reduce the impacts, but due to the proximity of the elevated structure to residential areas, the impacts would remain adverse despite mitigation. Mitigation measures to reduce visual impacts would include landscaping, using urban design techniques to reduce massing, and creating pedestrian-friendly surroundings.

- Neighborhood and Community Impacts: The East Option would have permanent adverse impacts on community character and cohesion that could not be mitigated due to the visual encroachment of the elevated structure into the neighborhood at 117th Street and Prairie Avenue in West Pullman. Mitigation measures for impacts on community character, including planting additional landscaping, would not be sufficient to offset this permanent impact. The East Option alignment would pass through the northwestern corner of Wendell Smith Park and the western portion of Block Park, and would displace Now Faith Church of God Holiness. The church could be relocated within the neighborhood. The East Option would largely leave the functional and recreational use of the parks intact and impacts would not be adverse after mitigation. Other impacts, benefits, and mitigation measures would be similar to those for the ROW Option, as discussed above in Section 5.3.1.1.2.

5.4.1.2 Segment UB

Impacts in Segment UB would be the same for all of the UPRR Rail Alternative options. Impacts and mitigation measures for Segment UB are discussed above in Section 5.3.1.2.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.2.1 Segment UA

5.4.2.1.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Historic and Cultural Resources: There would be no adverse construction effects on historic resources.

- Noise and Vibration: Based on the construction activities and equipment described in the Description of Construction, construction noise levels are not expected to exceed the FTA construction noise limits using noise-reducing construction practices.

- Energy: The construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: The East Option would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed for the elevated structure supports, at-grade trackbeds, and park & ride facilities. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.4.2.1.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Biological Resources: Although the East Option would affect a larger amount of vegetation than the ROW Option, there would be no adverse construction impacts on biological resources after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Hazardous Materials: There would be no adverse construction impacts relating to hazardous materials after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Land Use and Economic Development: Land use impacts from construction would not be adverse. Economic development impacts from construction would be beneficial. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Neighborhood and Community Impacts: There would be no adverse construction impacts relating to neighborhood and community impacts after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Parklands and Community Facilities: No parkland or community facilities would have adverse construction impacts after mitigations. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site, would not be adverse after mitigations, which include minimizing detour lengths.

- Visual and Aesthetic Conditions: The visual impacts related to construction would not be adverse after mitigation. The impacts and mitigation measures would be the similar to those for the ROW Option, discussed above in Section 5.3.2.1.

- Water Resources: The East Option alignment would be closer to the Roseland Pump Station than the ROW Option; consequently, additional care would need to be taken in the vicinity of the Roseland Pump Station and near the other underground utilities during construction. There would be no adverse construction impacts on water resources in Segment UA of the East Option. The impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Transportation: Construction of rail facilities, parking structures, and park & ride lots would require lane and sidewalk closures that would temporarily reduce roadway capacity. These closures may lead to temporarily increased travel times for both motorists and transit riders, and bus stop locations may be temporarily relocated. Bicycles and pedestrians would need to be rerouted around work areas. Detours would be provided to maintain access. Lanes on I-57 may also need to be temporarily closed to accommodate rail construction in the median, which would affect automobiles and freight trucks. Temporary closure of full sections of I-57 may also be needed. Closures would be scheduled during low-traffic periods to the extent feasible to minimize impacts. The UPRR freight tracks would remain active during construction. Temporary intermittent track closures may be needed; however, construction would be staged to minimize disruption. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.4.2.1.3 Topics with Adverse Construction Impacts After Mitigation

No adverse impacts would remain after mitigation.

5.4.2.2 Segment UB

Impacts in Segment UB would be the same for all of the UPRR Rail Alternative options. Construction impacts and mitigation measures for Segment UB are discussed above in Section 5.3.2.2.

5.4.3 120th Street Yard and Shop

Impacts of the 120th Street yard and shop would be the same for all of the UPRR Rail Alternative options. Impacts and mitigation measures for 120th Street yard and shop are discussed above in Section 5.3.3.

5.5 Union Pacific Railroad Rail Alternative - West Option

The UPRR Rail Alternative West Option would include extension of the Red Line from its current terminus at 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway medians and railroad corridors. The three options for the UPRR Rail Alternative are analyzed in two geographic segments, as described above in Section 5.3 for the ROW Option. The West Option alignment would run along the western side of the UPRR ROW in Segment UA. The alignment in Segment UB is the same for all three options.

New stations would be constructed at 103rd Street on the boundary between the Roseland and Washington Heights communities, at 111th Street in Roseland, at Michigan Avenue in West Pullman, and at 130th Street in Riverdale. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots, but multi-level parking structures would be constructed at the Michigan Avenue and 130th Street stations. To ensure analysis of the maximum foreseeable impacts, it is assumed for the East and West Options that the possible project being studied in the FSRRFS would not have occurred prior to RLE construction and UPRR would continue freight operations in its existing ROW. Compared to the ROW Option, the East and West Options would have greater displacement impacts due to the UPRR's requirement that the CTA tracks be located at least 50 feet from the active freight tracks. The West Option would require fewer displacements than the East Option, and a greater proportion of the displacements would be industrial instead of residential.

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.1.1 Segment UA

5.5.1.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Historic and Cultural Resources: Six resources in Segment UA have been identified as eligible for listing on the NRHP. No adverse effects on historic resources are anticipated to occur.

- Energy: Energy consumption would increase due to the addition of new tracks and stations to the rail system; however, this increase in energy would not be adverse, as it is not expected to affect local or regional energy availability or require the development of new sources. Some beneficial reduction in fuel consumption would occur if the RLE Project were to cause motorists to begin using transit for some trips.

- Geology and Soils: Operation of the West Option would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.5.1.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: The West Option would affect the greatest amount of vegetation compared to the other UPRR Rail Alternative options. With compliance with local tree protection ordinances, potential impacts would not be adverse.

- Displacements: The West Option would have fewer impacts than the East Option, but more than the ROW Option. In Segment UA, 47 buildings would be removed, of which 22 would be single-family residences, 8 would be commercial properties, 2 would be mixed-use properties, and 1 would be a place of worship. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area.

- Hazardous Materials: Given the proximity of the UPRR track to the alignment for the West Option, there would be the potential for impacts due to releases of hazardous materials being transported and from hazardous materials used in the routine operation and maintenance of the UPRR. These materials potentially exist along the railroad currently, but the UPRR Rail Alternative would bring transit vehicles closer to them. There would be no adverse permanent impacts related to hazardous materials after mitigation. These impacts and mitigation measures would be similar to those for the ROW Option, as described above in Section 5.3.1.1.

- Land Use and Economic Development: The West Option would affect the adjacent land uses along Fernwood Parkway, because it would be incompatible with the existing single-family residential development. Mitigation would include additional street trees along the west side of Eggleston Avenue and an evergreen tree buffer along the east side of Eggleston Avenue. The park & ride lots at the 103rd Street and 111th Street stations, the substation at 105th Street, and the parking garage at the Michigan Avenue Station would be inconsistent with adjacent land uses. These land uses consist of primarily single-family residential neighborhoods, with occasional commercial and apartment buildings. The West Option would displace the most commercial structures of any of the UPRR Rail Alternative Options; however, some are not fully utilized. The overall impact on land uses would not be adverse after mitigation. The overall impact on local economic development would be beneficial. The impacts and mitigation measures would be similar to those for the ROW Option, as discussed above in Section 5.3.1.1.

- Noise and Vibration: There would be no adverse noise impacts after mitigation. No adverse vibration impacts are anticipated. Impacts and mitigation measures would be similar to those for the East Option, as discussed above in Section 5.4.1.1.

- Parklands and Community Facilities: In segment UA, the West Option alignment would pass through the corner of Wendell Smith Park and most of Fernwood Parkway. No community facilities would be displaced. The West Option would largely leave the functional and recreational use of the parks intact and impacts would not be adverse after mitigation. Mitigation measures would include replacement parkland elsewhere in the surrounding neighborhoods, or improvement of existing park facilities. By improving travel time, operation of the West Option would improve access to parklands and community facilities within walking distance (½ mile) of the station locations. The parking garage at the Michigan Avenue station would provide space for retail and community facilities; this space would result in a benefit to the community overall.

- Safety and Security: The impact on major incidents would not be adverse. A large volume of pedestrians would be expected to cross the major streets near the stations without positive traffic control. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments as applicable in coordination with the results of traffic studies completed during the final design phase, resulting in no adverse permanent impacts after mitigation. The West Option would directly increase the number of vehicles (mostly buses) and pedestrians crossing the UPRR tracks at 103rd Street and 111th Street compared to the No Build Alternative, and could indirectly induce land development that would further increase traffic volumes. The risk of vehicle crashes would be mitigated by installing safety protection technologies for vehicles and pedestrians. Given that transit passengers are often in a hurry, and given the likely delays to pedestrians due to the expected increase in freight volumes over existing conditions, it is reasonable to assume that some pedestrians may choose to take unacceptable safety risks by crossing the tracks while the signals are flashing. Compared to the East Option, the volume of pedestrians crossing the tracks would be lower for the West Option because the parking lots would be located on the same side of the tracks as the stations. This adverse impact could be mitigated by incorporating a grade separation structure or providing pedestrian crossing gates at sidewalks. Traffic signals would need to be interconnected with the railroad crossing warning devices. Impacts on security at parking facilities would be mitigated by implementing open design and would not be adverse after mitigation. New train stations would be unlikely to have much, if any, impact on neighborhood crime. Suggested mitigation measures would be security surveillance cameras and sidewalk lighting along commercial streets within approximately one block of train station entrances. Impacts on neighborhood security would not be adverse after mitigation. Overall safety and security impacts would not be adverse after mitigation.

- Water Resources: Of the UPRR Rail Alternative option alignments, the West Option alignment would be furthest from the Roseland Pump Station and would have the least potential impact on underground pipes and structures around the pump station. There would be no adverse permanent impacts on water resources in Segment UA of the West Option. The impacts and mitigation measures would be similar to those for the ROW Option, described above in Section 5.3.1.1.2.

- Transportation: There would be four intersections in the AM peak and six intersections in the PM peak in Segment UA where the West Option would increase traffic congestion beyond applicable thresholds, largely due to cars accessing the park & ride facilities at stations. Mitigation measures such as optimization of signal cycles and removal of some on-street parking near stations would render traffic conditions no worse than under the No Build Alternative. The park & ride facilities may also draw some motorists away from nearby highways, thereby improving traffic flow for automobiles and freight trucks. The West Option would therefore have no impact on freight rail operations, because the rail line would be elevated above the UPRR ROW and no new grade crossings would be added. Existing bus routes would be adjusted to interface better with the RLE stations and service. New pedestrian and bicycle facilities would also be included near stations to provide safe access, including across the existing freight tracks, which would improve transit connections. Transit access to the project area would substantially improve, particularly for low-income residents who do not have access to automobiles. The overall transportation impacts would be beneficial.

5.5.1.1.3 Topics with Adverse Permanent Impacts After Mitigation

- Visual and Aesthetic Conditions: The elevated structure would cause adverse visual impacts between 99th Street and 103rd Street, near the 103rd Street station, and near the Michigan Avenue station park & ride facility. Mitigation measures to reduce visual impacts would include providing landscaping and replanting vegetation where possible, designing the park & ride facility to match the character of the surrounding neighborhood, using urban design techniques to reduce massing, and creating pedestrian-friendly surroundings. Exterior lighting would be shielded and carefully placed when adjacent to sensitive areas such as residential communities. The impacts would remain adverse after mitigation.

- Neighborhood and Community Impacts: The West Option would have permanent adverse impacts on community character and cohesion that could not be mitigated due to the visual encroachment of the elevated structure into the neighborhood between 99th and 103rd Streets in Washington Heights. The 103rd Street station in Roseland and Washington Heights and the Michigan Avenue station park & ride in West Pullman would also cause adverse visual impacts because they would change the scale, density, and character of the local community. Mitigation measures for impacts on community character, including planting additional landscaping, would not be sufficient to offset this permanent impact. The West Option alignment would pass through Fernwood Parkway, and would displace the Grace Temple Church of God Established in Christ. The church could be relocated within the neighborhood. CTA would keep the area beneath the track structure in Fernwood Parkway open for use, and improve park space elsewhere in the neighborhood. Mitigation measures, including screening the structure with additional landscaping, would not be sufficient to offset this impact.

5.5.1.2 Segment UB

Impacts in Segment UB would be the same for all of the UPRR Rail Alternative options. Impacts and mitigation measures for Segment UB are discussed above in Section 5.3.1.2.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.2.1 Segment UA

5.5.2.1.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Historic and Cultural Resources: There would be no adverse construction effects on historic resources.

- Noise and Vibration: Based on the construction activities and equipment described in the Description of Construction, construction noise levels are not expected to exceed the FTA construction noise limits using noise-reducing construction practices.

- Energy: The construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: The West Option would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed for the elevated structure supports, at-grade trackbeds, and park & ride facilities. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.5.2.1.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Biological Resources: Although the West Option would affect the greatest amount of vegetation compared to the other UPRR Rail Alternative options, there would be no adverse construction impacts on biological resources after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Hazardous Materials: There would be no adverse construction impacts relating to hazardous materials after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Land Use and Economic Development: The land use impacts from construction would not be adverse after mitigation. The economic development impacts from construction would be beneficial. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Neighborhood and Community Impacts: There would be no adverse construction impacts relating to neighborhood and community impacts after mitigation. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Parklands and Community Facilities: No parkland or community facilities would have adverse construction impacts after mitigations. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site would not be adverse after mitigations, which include minimizing detour lengths.

- Visual and Aesthetic Conditions: The visual impacts related to construction would not be adverse after mitigation. The impacts and mitigation measures would be similar to those for the ROW Option, discussed above in Section 5.3.2.1.

- Water Resources: Of the UPRR Rail Alternative option alignments, the West Option alignment would be furthest from the Roseland Pump Station and have the least potential impact on the underground pipes and structures around the pump station. There would be no adverse construction impacts on water resources in Segment UA of the West Option. Impacts and mitigation measures would be the same as those for the ROW Option, discussed above in Section 5.3.2.1.

- Transportation: Construction of rail facilities, parking structures, and park & ride lots would require lane and sidewalk closures that would temporarily reduce roadway capacity. These closures may lead to temporarily increased travel times for both motorists and transit riders, and bus stop locations may be temporarily relocated. Bicycles and pedestrians would need to be rerouted around work areas. Detours would be provided to maintain access. Lanes on I-57 may also need to be temporarily closed to accommodate rail construction in the median, which would affect automobiles and freight trucks. Temporary closure of full sections of I-57 may also be needed. Closures would be scheduled during low-traffic periods to the extent feasible to minimize impacts. The UPRR freight tracks would remain active during construction. Temporary intermittent track closures may be needed; however, construction would be staged to minimize disruption. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.5.2.1.3 Topics with Adverse Construction Impacts After Mitigation

No adverse impacts would remain after mitigation

5.5.2.2 Segment UB

Impacts in Segment UB would be the same for all of the UPRR Rail Alternative options. Construction impacts and mitigation measures for Segment UB are discussed above in Section 5.3.2.2.

5.5.3 120th Street Yard and Shop

Impacts of the 120th Street yard and shop would be the same for all of the UPRR Rail Alternative options. Impacts and mitigation measures for 120th Street yard and shop are discussed above in Section 5.3.3.

5.6 Halsted Rail Alternative

The Halsted Rail Alternative would involve extension of the Red Line from its current terminus at the 95th Street Terminal southward to Vermont Avenue via existing highway medians and the median of Halsted Street. The Halsted Rail Alternative is analyzed in two geographic segments:

- Segment HA: From the 95th Street Terminal to the 119th Street yard and shop area, including the communities of Roseland, Washington Heights, Morgan Park, and part of West Pullman

- Segment HB: south of the 119th Street yard and shop area, in the West Pullman community and the Village of Calumet Park

New stations would be constructed at 103rd Street on the boundary between the Roseland and Washington Heights community areas, at 111th Street on the boundary between the Roseland and Morgan Park community areas, at 119th Street in the West Pullman area, and at Vermont Avenue in West Pullman. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots; however, a multi-level parking structure would be constructed at the Vermont Avenue station.

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

5.6.1.1 Segment HA

5.6.1.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Biological Resources: Halsted Street is currently developed with commercial land uses. The introduction of an elevated rail line would have no impact on vegetation and wildlife habitats along this route.

- Energy: Energy consumption would increase due to the addition of new tracks and stations to the rail system; however, this increase in energy would not be adverse, as it is not expected to affect local or regional energy availability, or require the development of new sources. Some beneficial reduction in fuel consumption would occur if the RLE Project were to cause motorists to begin using transit for some trips.

- Geology and Soils: Operation of the Halsted Rail Alternative would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.6.1.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Displacements: The Halsted Rail Alternative would have the fewest displaced residences and the most displaced commercial buildings of the rail alternatives. A total of 17 buildings would be displaced in Segment HA, of which 11 would be commercial buildings and 4 would be mixed-use buildings. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area.

- Hazardous Materials: Operation of the Halsted Rail Alternative would have the potential to result in the release of hazardous materials and/or petroleum products into the environment from accidental spills. Spills are most likely to occur during activities such as equipment and grounds maintenance. Materials typically used for these activities include fuel, oil, paints, solvents, cleaning agents, herbicides, and pesticides. Adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures, would minimize the potential for impacts.

- Land Use and Economic Development: The substations at 101st Street, 110th Street, and 118th Street, and the park & ride lots at the 103rd Street and 111th Street stations would be inconsistent with adjacent land uses. These uses consist primarily of street-facing commercial developments along Halsted Street, with single-family residential on surrounding blocks. The Halsted Rail Alternative would require the most commercial building displacements of the alternatives under consideration for the RLE Project; however, some of the lost commercial space would be replaced on the ground floor of the station parking facilities or in new development incentivized by the new transit line. Mitigations include zoning variances, screening, landscaping, lighting appropriate for adjacent land uses, and appropriate architectural design and massing. Property displacements would be mitigated through just compensation and relocation assistance as required by the Uniform Act. There would be no adverse permanent impacts on land use following proposed mitigation measures. The overall impact on local economic development would be beneficial.

- Noise and Vibration: There would be a substantial number of affected receptors in areas where the train speeds would reach 55 mph. Noise-affected residential receptors along the project corridor would require mitigation. A 3- to 4-foot-high noise barrier installed along the outer tracks of the aerial structure would reduce the wheel-rail noise that would propagate into the surrounding community. There would be moderate (not adverse) noise impacts after mitigation. No adverse vibration impacts are anticipated.

- Parklands and Community Facilities: The Halsted Rail Alternative Segment HA would not pass through any parkland; however, the alternative would displace one community facility, the Illinois Department of Employment Security office, which could be relocated nearby. After mitigation, the operation of the Halsted Rail Alternative would not result in adverse impacts. By improving travel time, operation of the ROW Option would improve access to community facilities within walking distance (½ mile) of the station locations.

- Neighborhood and Community Impacts: The overall community character impact of adding the elevated structure to the neighborhood would be negative, but not adverse. The Halsted Rail Alternative would displace one community resource in Segment HA: the Illinois Department of Employment Security office, which would be moved to another location nearby to avoid adverse impacts. See Section 5.3.1.1.2 for proposed mitigation measures.

- Safety and Security: The impact on major incidents would not be adverse. A large volume of pedestrians would be expected to cross the major streets near the stations without positive traffic control. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments as applicable in coordination with the results of traffic studies completed during the final design phase, resulting in no adverse permanent impacts after mitigation. Impacts on security at parking facilities would be mitigated by implementing open design and would not be adverse after mitigation. New train stations would be unlikely to have much, if any, impact on neighborhood crime. Overall safety and security impacts would not be adverse after mitigation.

- Water Resources: There would be no adverse permanent impacts on water resources in Segment HA after mitigation. Pervious area is anticipated to decrease in some areas; the decrease in pervious area could be mitigated by incorporating new stormwater management structures and establishing an erosion control plan. The rail service would replace automobile trips; there would be an associated reduction in runoff contaminants that collect on streets. For this reason, the Halsted Rail Alternative is anticipated to have a minor but positive water quality impact. Due to the predominance of impervious surfaces throughout the project area, minimal percolation to the underlying groundwater occurs in the API; therefore, any potential increases in contaminated surface water runoff would have no adverse impact on groundwater quality. There would be no adverse permanent impacts on stormwater after mitigation.

- Transportation: There would be four intersections in the AM peak and six intersections in the PM peak in Segment HA where the Halsted Rail Alternative would increase traffic congestion beyond applicable thresholds, largely due to cars accessing the park & ride facilities at stations. Mitigation measures such as optimization of signal cycles would render traffic conditions no worse than under the No Build Alternative. The park & ride facilities may also draw some motorists away from nearby highways, thereby improving traffic flow for automobiles and freight trucks. The Halsted Rail Alternative would have no impact on freight rail operations, because it would only cross above the UPRR ROW in the median of I-57. Existing bus routes would be adjusted to interface better with the RLE stations and service. New pedestrian and bicycle facilities would also be included near stations to provide safe access, which would improve transit connections. The Halsted Rail Alternative would also provide a convenient point for bicyclists to access the Major Taylor Trail at 119th Street. Transit access to the project area would substantially improve, particularly for low-income residents who do not have access to automobiles. The overall transportation impacts would be beneficial.

5.6.1.1.3 Topics with Adverse Permanent Impacts After Mitigation

- Historic and Cultural Resources: Three resources and one district in Segment HA have been identified as eligible for listing on the NRHP. One of the resources would be adversely affected due to alteration of setting: the substation at 10227 S. Halsted Street.

- Visual and Aesthetic Conditions: The Halsted Rail Alternative would have adverse impacts at the transition from the I-57 ROW to Halsted Street. The visual impact due to the height of the elevated structure could not be mitigated.

5.6.1.2 Segment HB

5.6.1.2.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Biological Resources: Halsted Street is currently developed with commercial land uses. The introduction of an elevated rail line would have no impact on vegetation and wildlife habitats along this route.

- Energy: Energy consumption would increase due to the addition of new tracks and stations to the rail system; however, this increase in energy would not be adverse, as it is not expected to affect local or regional energy availability, or require the development of new sources. Some beneficial reduction in fuel consumption would occur if the RLE Project were to cause motorists to begin using transit for some trips.

- Geology and Soils: Operation of the Halsted Rail Alternative would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.6.1.2.2 Topics with No Adverse Permanent Impacts After Mitigation

- Displacements: The Halsted Rail Alternative would have the fewest displaced single-family residences and the most displaced commercial buildings of the rail alternatives. A total of 15 buildings would be displaced in Segment HB, of which 11 would be single-family residences and 4 would be commercial properties. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area.

- Hazardous Materials: There would be no adverse permanent impacts related to hazardous materials after mitigation. Impacts and mitigation measures for Segment HB would be the same as those for Segment HA, as discussed above in Section 5.6.1.1.

- Noise and Vibration: No severe noise impacts would remain after mitigation. No adverse vibration impacts are anticipated. Impacts and mitigation measures for Segment HB would be the same as those for Segment HA, as discussed above in Section 5.6.1.1.

- Parklands and Community Facilities: The Halsted Rail Alternative Segment HB alignment would not pass through any parkland or displace any community facilities. By improving travel time, operation of the alternative would improve access to community facilities within walking distance (½ mile) of the station locations.

- Safety and Security: The impact on major incidents would not be adverse. A large volume of pedestrians would be expected to cross the major streets near the stations without positive traffic control. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments as applicable in coordination with the results of traffic studies completed during the final design phase, resulting in no adverse permanent impacts after mitigation. Impacts on security at parking facilities would be mitigated by implementing open design and would not be adverse after mitigation. New train stations would be unlikely to have much, if any, impact on neighborhood crime. Overall safety and security impacts would not be adverse after mitigation.

- Water Resources: There would be no adverse permanent impacts on water resources in Segment HB after mitigation. Impacts and mitigation measures for Segment HB would be the same as those for Segment HA, as discussed above in Section 5.6.1.1.

- Transportation: There would be nine intersections in the AM peak and nine intersections in the PM peak in Segment HB where the Halsted Rail Alternative would increase traffic congestion beyond applicable thresholds, largely due to cars accessing the park & ride facilities at stations. Mitigation measures such as optimization of signal cycles, addition of turn lanes, and restriping of through and turn lanes would render traffic conditions no worse than under the No Build Alternative. The park & ride facilities may also draw some motorists away from nearby highways, thereby improving traffic flow for automobiles and freight trucks. There are no freight rail tracks in the area, and the Halsted Rail Alternative would have no impact on passenger rail operations, because it would only cross above the Metra Electric District tracks at Halsted Street. Existing bus routes would be adjusted to interface better with the RLE stations and service. New pedestrian and bicycle facilities would also be included near stations to provide safe access, which would improve transit connections. Transit access to the project area would substantially improve, particularly for low-income residents who do not have access to automobiles. Unlike the BRT and UPRR Rail Alternatives, the Halsted Rail Alternative would not serve the Altgeld Gardens public housing project. The overall transportation impacts would be beneficial.

5.6.1.2.3 Topics with Adverse Permanent Impacts After Mitigation

- Historic and Cultural Resources: Two resources in Segment HB have been identified as eligible for listing on the NRHP, and both are anticipated to be adversely affected due to change in setting: the church at 12433-12439 S. Halsted Street and the cemetery gatehouse at 12540 S. Halsted Street.

- Land Use and Economic Development: The substation at 126th Street would be inconsistent with adjacent land uses, which are primarily single-story homes. Due to the large size of the garage at the Vermont Avenue station, the impact on existing land use character would be adverse. Some commercial displacements would be necessary; however, some of the lost commercial space could be replaced on the ground floor of the station parking facilities or in new development incentivized by the new transit line. Mitigations include zoning variances, screening, landscaping, lighting appropriate for adjacent land uses, and appropriate architectural design and massing. Property displacements would be mitigated through just compensation and relocation assistance as required by the Uniform Act. There would be no adverse permanent impacts on land use following proposed mitigation measures other than the garage at the Vermont Avenue station. The overall impact on local economic development would be beneficial.

- Neighborhood and Community Impacts: The Halsted Rail Alternative would have an adverse impact on visual character that cannot be mitigated in the West Pullman community along Green Street between Vermont Avenue and 128th Place. The single-family homes on the east side of the block would be acquired and removed to construct a seven-story park & ride garage. The garage would be out of scale and inconsistent with the single-story residential character of the neighborhood. No available mitigation measures would effectively offset this adverse impact.

- Visual and Aesthetic Conditions: The Vermont Street station would have adverse impacts after mitigation. Mitigations to reduce visual impacts would include shielding exterior lighting and providing special consideration for lighting placement adjacent to sensitive areas such as residential communities; providing landscaping and/or visual screening at park & ride locations where possible; designing the parking structure to match the character of the surrounding fabric; and using urban design techniques to reduce massing. The height of the park & ride structure at Vermont Station and its proximity to residences would cause an adverse visual impact despite mitigation.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

5.6.2.1 Segment HA

5.6.2.1.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Noise and Vibration: Based on the types of construction equipment and activities identified in the Description of Construction, construction noise levels are not expected to exceed the FTA construction noise limits.

- Energy: The construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: The Halsted Rail Alternative would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed for the elevated structure supports, at-grade trackbeds, and park & ride facilities. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.6.2.1.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as described above in Section 5.3.2.1.

- Biological Resources: There would be no adverse construction impacts on biological resources after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as described above in Section 5.3.2.1.

- Hazardous Materials: There would be no adverse construction impacts related to hazardous materials after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as described above in Section 5.3.2.1.

- Land Use and Economic Development: The land use impacts from construction would not be adverse after mitigation. Due to the nature and size of the small businesses along Halsted Street, some businesses might not be able to maintain their customer base and could potentially lose business from construction-related disruptions. Mitigation methods would include focusing construction activities primarily during the least impactful times of day and other best management practices. There would be short-term beneficial economic impacts from construction jobs. Due to the short-term nature of construction activities, these impacts would not be adverse.

- Parklands and Community Facilities: After mitigation, no parkland or community facilities would have adverse construction impacts. Construction activities would generate temporary noise and air quality impacts, and change access to parks and community facilities. These impacts would be temporary in nature and would be mitigated through the use of construction best management practices; by alerting users of construction activities; and by providing clearly marked detour routes and alternate parking.

- Neighborhood and Community Impacts: Construction activities would be more disruptive than they would be under the UPRR Rail Alternative, because the Halsted Rail Alternative elevated structure would be built in the median of a major commercial street instead of on private, off-street ROW. Community disruption would occur during construction activities, with intensive construction occurring over a period of approximately 3 years. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. Temporary dust, noise, and visual impacts would occur. Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Businesses around the alignment and parking structure could be affected by construction activities, construction-related traffic, and road and sidewalk closures. This potentially adverse impact would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses during construction.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site, would not be adverse after mitigation, which includes minimizing detour lengths.

- Visual and Aesthetic Conditions: The visual impacts related to construction would not be adverse after mitigation. At locations where park & ride facilities would be created, impacts would include construction fencing, demolition of existing buildings or clearing of vacant lots, temporary street closures and related signage, or temporary lighting or entrances. The CTA would attempt to maintain as much existing vegetation as practical during construction, and would minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites.

- Water Resources: There would be no adverse construction impacts on drainage, groundwater, or water quality after mitigation. There would be no adverse construction impacts on water resources after mitigation. Stormwater drainage mitigation measures would include incorporating new stormwater management structures and establishing an erosion control plan, including for construction activities at the locations of garages and park & ride lots. Water quality mitigation measures would include installing properly designed and maintained biological oil and grease removal systems, proper storage of hazardous materials, development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials, proper storage and maintenance of equipment, periodic removal of landscape and construction debris, installation of detention basins to remove suspended solids, and regular monitoring of runoff water quality.

- Transportation: Construction of rail facilities, parking structures, and park & ride lots would require lane and sidewalk closures that would temporarily reduce roadway capacity. Temporary full closures of sections of Halsted Street would be needed for superstructure placement. These closures would cause temporarily increased travel times for both motorists and transit riders, and bus stop locations may be temporarily relocated. Bicycles and pedestrians would need to be rerouted around work areas. Detours would be provided to maintain access. Lanes on I-57 may also need to be temporarily closed to accommodate rail construction in the median, which would affect automobiles and freight trucks. Temporary full closure of sections of I-57 may also be needed. Closures would be scheduled during low-traffic periods to the extent feasible to minimize impacts. The UPRR freight tracks would remain active during construction. Temporary intermittent track closures may be needed to construct the elevated track in the median of I-57; however, construction would be staged to minimize disruption. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.6.2.1.3 Topics with Adverse Construction Impacts After Mitigation

- Historic and Cultural Resources: Three resources and one district in Segment HA have been identified as eligible for listing on the NRHP. One of the resources would be adversely affected due to alteration of setting: the substation at 10227 S. Halsted Street.

5.6.2.2 Segment HB

5.6.2.2.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Noise and Vibration: Based on the types of construction equipment and activities identified in the Description of Construction, construction noise levels are not expected to exceed the FTA construction noise limits.

- Energy: The construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: The Halsted Rail Alternative would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the alignment. Excavation would be primarily needed for the elevated structure supports and park & ride facilities. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.6.2.2.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as described above in Section 5.3.2.1.

- Biological Resources: There would be no adverse construction impacts on biological resources after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as described above in Section 5.3.2.1.

- Hazardous Materials: There would be no adverse construction impacts related to hazardous materials after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as described above in Section 5.3.2.1.

- Neighborhood and Community Impacts: There would be no adverse construction impacts on neighborhoods and communities after mitigation. Impacts and mitigation measures would be similar to those for Segment HA, as described above in Section 5.6.2.1.

- Parklands and Community Facilities: After mitigation, no parkland or community facilities would have adverse construction impacts. Impacts and mitigation measures would be similar to those for Segment HA, as described above in Section 5.6.2.1.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site, would not be adverse after mitigation, which includes minimizing detour lengths.

- Visual and Aesthetic Conditions: Construction impacts would be longer in nature at the Vermont Avenue station than at others along the RLE due to the need to construct a multi-level parking structure. Otherwise, impacts and mitigations would be similar to those for Segment HA, as described above in Section 5.6.2.1.

- Land Use and Economic Development: The land use impacts from construction would not be adverse after mitigation. Due to the nature and size of the small businesses along Halsted Street, some businesses might not be able to maintain their customer base and could potentially lose business from construction-related disruptions. This effect would be less pronounced in Segment HB because there are fewer businesses along this portion of Halsted Street than in Segment HA. Mitigation methods would include focusing construction activities primarily during the least impactful times of day and other best management practices. There would be short-term beneficial economic impacts from construction jobs. Due to the short-term nature of construction activities, these impacts would not be adverse.

- Water Resources: There would be no adverse construction impacts on water resources after mitigation. Impacts and mitigation measures would be similar to those for the UPRR Rail Alternative, as discussed above in Section 5.3.2.1.

- Transportation: Construction of rail facilities, parking structures, and park & ride lots would require lane and sidewalk closures that would temporarily reduce roadway capacity. Temporary full closures of sections of Halsted Street would be needed for superstructure placement. These closures would cause temporarily increased travel times for both motorists and transit riders, and bus stop locations may be temporarily relocated. Bicycles and pedestrians would need to be rerouted around work areas. Closures would be scheduled during low-traffic periods to the extent feasible to minimize impacts. The Metra Electric District passenger rail tracks would remain active during construction. Temporary intermittent track closures may be needed to construct the elevated track in the median of Halsted Street; however, construction would be staged to minimize disruption. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.6.2.2.3 Topics with Adverse Construction Impacts After Mitigation

- Historic and Cultural Resources: Two resources in Segment HB have been identified as eligible for listing on the NRHP, and both are anticipated to be adversely affected due to change in setting: the church at 12433-12439 S. Halsted Street and the cemetery gatehouse at 12540 S. Halsted Street.

5.6.3 119th Street Yard and Shop

5.6.3.1 Permanent Impacts and Mitigations

5.6.3.1.1 Topics with No Adverse Permanent Impacts

- Air Quality and Climate Change: No adverse air quality impacts from CO, GHG, $PM_{2.5}$, or MSAT emissions are anticipated.

- Noise and Vibration: The noise generated at the 119th Street yard and shop would not exceed the FTA impact criteria at the residential receptors along 119th Street. As a result, noise mitigation would not be required for the 119th Street yard and shop. No adverse vibration impacts are anticipated.

- Transportation There would be no permanent adverse impacts on bicycle or pedestrian access resulting from the 119th Street yard and shop. Pedestrian access by the general public would be restricted and discouraged. Existing sidewalk near the yard along 119th, 120th, and Peoria Streets would remain. Because of the location of the yard, no public transportation would be affected. Existing on-street parking on Peoria Street would not be affected. Some parking would be provided for yard employees.

- Energy: Yard and shop operation would require additional fuel and energy resources, but not to the extent that it would affect local or regional fuel and energy availability, or require development of new energy sources. As such, no adverse impacts would occur.

- Geology and Soils: Operation of the 119th Street yard and shop would not cause adverse changes to geology or soil resources.

- Cumulative: No cumulative adverse impacts are expected.

5.6.3.1.2 Topics with No Adverse Permanent Impacts After Mitigation

- Biological Resources: There are a few relatively small patches of regenerating vegetation within the yard and shop area that could be used by migratory birds. Mitigation measures would be implemented during construction to avoid potential impacts. Mitigation measures may be required to reduce potential impacts on wildlife habitat, including preparing a detailed tree inventory, timing tree removal to occur outside the migratory bird nesting season, performing biological surveys if construction must occur during the nesting season, and replanting trees as required by applicable local codes and ordinances. There would be no adverse construction impacts on biological resources after mitigation.

- Displacements: The permanent envelope would affect six buildings within the West Pullman neighborhood, of which two would be mixed-use buildings and one would be a place of worship. With just compensation and relocation assistance per the Uniform Act, the permanent impacts would not be adverse, because there is available vacant land in the project area for relocation purposes.

- Hazardous Materials: There would be no adverse permanent impacts related to hazardous materials after mitigation. Operation of yard and shop would have the potential to result in the release of hazardous materials and/or petroleum products into the environment from accidental spills or from maintenance activities that require earthmoving in contaminated areas, which potentially exist on site. Additional information regarding such locations is provided in Section 4 of the *Hazardous Materials Technical Memorandum*. Measures to avoid such occurrences would include adherence to applicable federal, state, and local regulations, as well as CTA's existing system-wide hazardous material usage, storage, and disposal plans and procedures.

- Land Use and Economic Development: The yard and shop, as well as adjacent substation, would be located within an industrial area; therefore, these facilities would be consistent with existing land uses. The impact on existing land uses would not be adverse. The overall economic development impact would be beneficial.

- Neighborhood and Community Impacts: Neither the park & ride lot or the yard and shop facility would contribute to the growth and development of the community, which would reduce the overall potential of the Halsted Rail Alternative to encourage new development in the 119th Street station area; however, development could still occur in the remainder of the station area. Removal of the church and other property along Halsted Street would not be adverse after compliance with the Uniform Act. Other buildings in the area could be upgraded and adapted as replacements. There would be no adverse permanent impacts on neighborhoods and communities after mitigation.

- Parklands and Community Facilities: The 119th Street yard and shop would not pass through any parkland; however, the ROW would displace a place of worship, as discussed above under Neighborhood and Community Impacts.

- Safety and Security: Impacts on security at the 119th Street yard and shop would not be adverse after mitigation. Mitigation measures would include complying with relevant design standards to minimize intrusion and prevent graffiti.

- Visual and Aesthetic Conditions: The yard and shop would dramatically change the character and scale of the surrounding area, which includes light commercial and residential neighborhoods. Mitigations to reduce visual impacts would include shielding exterior lighting and providing special consideration for lighting placement adjacent to sensitive areas such as residential communities and providing landscaping and/or visual screening around the yard and shop where possible. Additional measures for the yard and shop would include designing the shop facility to be aesthetically compatible with surrounding structures and screening the yard through fencing, walls, or vegetation wherever necessary and possible. The permanent visual impacts would not be adverse after mitigation.

- Water Resources: There would be no adverse permanent impacts on water resources at the 119th Street yard and shop property after mitigation. Impacts and mitigation measures would be similar to those described for the UPRR Rail Alternative's 120th Street yard and shop above in Section 5.3.3.1.

5.6.3.1.3 Topics with Adverse Permanent Impacts After Mitigation

- Historic and Cultural Resources: One resource in the vicinity of the 119th Street yard and shop has been identified as eligible for listing on the NRHP, and is anticipated to be adversely affected due to alteration of setting: the Fire Department house at 931 W. 120th Street.

5.6.3.2 Construction Impacts and Mitigations

5.6.3.2.1 Topics with No Adverse Construction Impacts

- Displacements: Because all construction activities would occur on land acquired for the permanent ROW, there would be no temporary displacement or relocation construction impacts.

- Land Use and Economic Development: Because the yard and shop would be located in an industrial area, the construction activities would not be adverse for land use or economic development.

- Noise and Vibration: Based on the construction activities and equipment identified in the Description of Construction, construction noise levels are not expected to exceed the FTA construction noise limits using noise-reducing construction practices.

- Energy: Yard and shop construction activities identified in the Description of Construction would not require fuel consumption and energy use at a scale that would adversely affect energy availability, and would not require development of new energy sources. No adverse impacts would occur.

- Geology and Soils: Construction of the 119th Street yard and shop would require few changes to surficial geology and soils, which have been affected by prior development in all parts of the site. Excavation would be primarily needed for the at-grade trackbeds and shop buildings. Excavation activities are not expected to have adverse impacts.

- Cumulative: No adverse cumulative impacts are expected to occur. There are not currently any foreseeable nearby projects of sufficient magnitude to cause impacts that would be under construction at the same time as RLE. Should such a project occur, CTA would coordinate construction activities to minimize impacts.

5.6.3.2.2 Topics with No Adverse Construction Impacts After Mitigation

- Air Quality and Climate Change: No adverse air quality impacts due to construction activities are anticipated after mitigation. Proper traffic management during the construction period would mitigate any potential adverse effects. A Dust Control Plan would address in detail how dust would be controlled at all times at the construction site, the staging areas, and the access and egress routes.

- Biological Resources: There would be no adverse construction impacts on biological resources after mitigation. Impacts and mitigation measures would be similar to those described for the UPRR Rail Alternative's 120th Street yard and shop above in Section 5.3.3.2.

- Hazardous Materials: There would be no adverse construction impacts relating to hazardous materials after mitigation. Construction would result in generation of a large quantity of soil that could contain contaminated materials requiring off-site disposal. Such soils potentially exist on-site, and additional information regarding such locations is provided in Section 4 of the *Hazardous Materials Technical Memorandum*. Contaminated materials potentially encountered could include heavy metals, asbestos-containing material, and lead-based paint. Mitigation measures would include compliance with federal, state, and local laws and regulations regarding hazardous materials; focused site assessments for areas where earthmoving activities would occur; hazardous materials surveys of buildings; a Contaminated Material Management Plan; Health and Safety Plans for construction activities; Spill Prevention, Control, and Countermeasure Plans; and Construction Stormwater Pollution Prevention Plans.

- Neighborhood and Community Impacts: Temporary dust, noise, and visual impacts would occur on an intermittent basis, but impacts would not be adverse provided that best management practices were employed and nighttime construction near residences were limited to the extent practicable.

- Parklands and Community Facilities: After mitigation, no parkland or community facilities would have adverse construction impacts. Mitigation would include relocation of the displaced church, as described under operation impacts above in Section 5.6.3.1.

- Safety and Security: Impacts on emergency services, including access to the construction site and travel around the site, would not be adverse after mitigation, which includes minimizing detour lengths.

- Visual and Aesthetic Conditions: The construction of the yard and shop would last 1 to 3 years and would have high visual impacts. The removal of existing buildings and parking lots, including associated debris, would be more substantial than other locations along the project corridor. The visual impacts related to construction would not be adverse after mitigation. The CTA would attempt to maintain as much existing vegetation as practical during construction, and minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites.

- Water Resources: There would be no adverse construction impacts on water resources at the 119th Street yard and shop property after mitigation. Impacts and mitigation measures would be similar to those described for the UPRR Rail Alternative's 120th Street yard and shop above in Section 5.3.3.2.

- Transportation: The construction associated with the 119th Street yard and shop would temporarily affect the physical capacity of roadways and intersections requiring detours at 120th Street and Halsted Street. Superstructure erection would require temporary closure of all traffic along sections of Halsted Street. This may cause increased travel times for automobiles and transit users, and possibly shift traffic volumes to other streets. Bus stop locations may be temporarily closed or relocated during construction activities, and detours would be necessary. Temporary lane closures on portions of 119th Street and 120th Street may occur due to maintenance of traffic activities during construction. With adherence to established construction management guidelines for rerouting traffic and transit service, no adverse construction impacts would occur after mitigation.

5.6.3.2.3 Topics with Adverse Construction Impacts After Mitigation

- Historic and Cultural Resources: One resource in the vicinity of the 119th Street yard and shop has been identified as eligible for listing on the NRHP, and is anticipated to be adversely affected due to alteration of setting: the Fire Department house at 931 W. 120th Street.

Section 6
Impacts Remaining After Mitigation

As discussed above in Section 5, none of the alternatives would have disproportionately high and adverse effects on Environmental Justice populations. The entire project area comprises predominantly minority populations. All of the impacts and benefits of the alternatives would accrue to the same minority populations, and few project benefits would occur outside the project area. Some of the alternatives would, however, still result in non-disproportionate adverse impacts that cannot be mitigated, as summarized in the following subsections and in Table 6-1. Construction and cumulative impacts are discussed under each of the other impact categories where applicable.

Table 6-1: Adverse Impacts Remaining After Mitigation by Alternative (Not Disproportionate)

Impact Category	No Build	BRT	UPRR ROW Option	UPRR East Option	UPRR West Option	Halsted
Displacements	No	No	No	No	No	No
Land Use and Economic Development	No	No	No	No	No	Yes
Noise and Vibration	No	No	No	No	No	No
Energy	No	No	No	No	No	No
Air Quality and Climate Change	No	No	No	No	No	No
Biological Resources	No	No	No	No	No	No
Hazardous Materials	No	No	No	No	No	No
Neighborhood and Community	No	No	No	Yes	Yes	Yes
Parklands and Community Facilities	No	No	No	No	No	No
Safety and Security	No	No	No	No	No	No
Visual and Aesthetic Conditions	No	No	No	Yes	Yes	Yes
Water Resources	No	No	No	No	No	No
Transportation	No	No	No	No	No	No
Historic and Cultural Resources	No	No	No	No	No	Yes
Geology and Soils	No	No	No	No	No	No
Cumulative	No	No	No	No	No	No

BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad, ROW = Right-of-Way

6.1 No Build Alternative

No adverse impacts would occur as a result of the No Build Alternative. As such, there would be no disproportionately high and adverse effects on low-income and minority populations. The communities in the project area are, however, currently underserved by the CTA rail system compared to many other parts of Chicago, and the No Build Alternative would lack the beneficial increase in economic development and livability that the build alternatives would provide.

6.2 Bus Rapid Transit Alternative

The BRT Alternative would result in permanent noise and vibration impacts that would affect both residences and community facilities along the alignment. Impacts would not disproportionately affect minority or low-income populations.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

6.3.1 Segment UA

The ROW Option would have no adverse impacts after mitigation. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.3.2 Segment UB

The ROW Option would have no adverse impacts after mitigation. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.3.3 120th Street Yard and Shop

The 120th Street yard and shop would have no adverse impacts after mitigation. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.4 Union Pacific Railroad Rail Alternative - East Option

6.4.1 Segment UA

The East Option would have adverse impacts remaining after mitigation in Segment UA in the following categories:

- Visual and Aesthetic Conditions (related to community visual character north of I-57 and at 117th Street and Prairie Avenue)
- Neighborhood and Community Impacts (related to community visual character north of I-57 and at 117th Street and Prairie Avenue)

Impacts and benefits would occur entirely within the same minority and low-income communities. As such, no disproportionately high and adverse effects on minority or low-income communities would occur.

6.4.2 Segment UB

The East Option would have no adverse impacts after mitigation in Segment UB. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.4.3 120th Street Yard and Shop

The 120th Street yard and shop would have no adverse impacts after mitigation. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.5 Union Pacific Railroad Rail Alternative - West Option

6.5.1 Segment UA

The West Option would have adverse impacts remaining after mitigation in Segment UA in the following categories:

- Visual and Aesthetic Conditions (related to community visual character north of I-57, between 99th and 103rd Streets, near 103rd Street station, and near Michigan Avenue station)
- Neighborhood and Community Impacts (related to community visual character north of I-57, between 99th and 103rd Streets, near 103rd Street station, and near Michigan Avenue station)

Impacts and benefits would occur entirely within the same minority and low-income communities. As such, no disproportionately high and adverse effects on minority or low-income communities would occur.

6.5.2 Segment UB

The West Option would have no adverse impacts after mitigation in Segment UB. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.5.3 120th Street Yard and Shop

The 120th Street yard and shop would have no adverse impacts after mitigation. As such, there would be no disproportionately high and adverse effects on low-income and minority populations.

6.6 Halsted Rail Alternative

6.6.1 Segment HA

The Halsted Rail Alternative would have adverse impacts remaining after mitigation in Segment HA in the following categories:

- Historic and Cultural Resources
- Visual and Aesthetic Conditions (related to community visual character at the transition from I-57 to Halsted Street)

Impacts and benefits would occur entirely within the same minority and low-income communities. As such, no disproportionately high and adverse effects on minority or low-income communities would occur.

6.6.2 Segment HB

The Halsted Rail Alternative would have adverse impacts remaining after mitigation in Segment HB in the following categories:

- Historic and Cultural Resources
- Land Use and Economic Development
- Neighborhood and Community Impacts (related to community visual character at Vermont Station)
- Visual and Aesthetic Conditions (related to community visual character at Vermont Station)

Impacts and benefits would occur entirely within the same minority and low-income communities. As such, no disproportionately high and adverse effects on minority or low-income communities would occur.

6.6.3 119th Street Yard and Shop

The 119th Street yard and shop would have adverse impacts remaining after mitigation in the category of Historic and Cultural Resources. Impacts and benefits would occur entirely within the same minority and low-income communities. As such, no disproportionately high and adverse effects on minority or low-income communities would occur.

Appendix A
Limited English Proficiency (LEP) Assessment

CWC Transit Group

Memorandum

To: *CTA*

From: *CWC Transit Group*

Date: *July 13, 2009*

Subject: *Red Line Extension Limited English Proficiency Assessment*

Upon further analysis of the Limited English Proficiency (LEP) needs of the CTA Red Line Extension Project Area, we have determined that public outreach materials should be prepared in both English and Spanish.

Looking at census data within each tract adjacent to the Locally Preferred Alternative (LPA) we see that there are several tracts where over 35% of the citizens speak Spanish/Spanish Creole. Construction of the Red Line Extension Project can have large impacts on the community, even more so on the properties adjacent to the LPA. The CTA needs to ensure that every citizen potentially affected by this project is made aware of possible impacts on their neighborhood.

Analysis was conducted at the tract level by specifically selecting those tracts adjacent to the LPA Right of Way (ROW). Refer to the attached LEP Baseline Report (Enclosure 1) and the corresponding Census Tract map (Enclosure 2) for detailed data on the specific tracts and languages used within each.

Enclosures:

2. ***Map of Census Tracts along LPA ROW***

cc: ***Melissa Peters***

Limited English Proficiency (LEP) Baseline Report

CTA Red Line

Executive Order 13166 "Improving Access to Services for Persons with Limited English Proficiency" requires all recipients of federal funds to provide meaningful access to persons who are limited in their English proficiency (LEP). The United States (U.S.) Department of Justice defines LEP individuals as those "who do not speak English as their primary language and who have a limited ability to read, write, speak, or understand English" (67 FR 41459). Data about LEP populations was gathered in the U.S. Census 2000. For data analysis purposes, the Census divides the states of the United States into counties and divides counties into tracts.

Within area tracts, Census data record the presence of persons who describe their ability to speak English as less than "Very Well." The table below shows the percentages of adults who speak English less than "Very Well" by language category. Additionally, 175 households or 1.0% of households within area tracts reported to the Census that their household was linguistically isolated, meaning that all household members over the age of fourteen had at least some difficulty with English. Thus, Census data indicate the presence of LEP populations.

Table. Census Data: Percent of Adult Speakers Who Speak English Less than Very Well*

		Percent of Adult Speakers Who Speak English Less than Very Well			
Census Geographies	**Total Adult Population**	**Spanish Language Speakers**	**Other Indo European Language Speakers**	**Asian and Pacific Island Language Speakers**	**Other Language Speakers**
Tracts					
Tract 4906.00 Cook County	1,331	0.6%	0.0%	0.5%	0.0%
Tract 4907.00 Cook County	2,709	0.6%	0.3%	0.0%	0.2%
Tract 4910.00 Cook County	4,356	0.7%	0.4%	0.4%	0.0%
Tract 4911.00 Cook County	3,986	0.7%	0.0%	0.0%	0.0%
Tract 4912.00 Cook County	1,949	0.3%	0.3%	0.0%	0.0%
Tract 4913.00 Cook County	2,470	1.5%	0.3%	0.0%	0.0%

Data Source: United States Census 2000 (Table P19) as of February 9, 2008 for persons age 18 and older.

* The data on ability to speak English represent the Census respondent's own perception about his ability to speak English (United States Census 2000 Metadata).

Since LEP is partially defined as a limited ability to read and write English, literacy data were also consulted. Indirect literacy estimates for adults were calculated by the National Center for Education Statistics based on 2003 survey data for states and counties. None of the geographies in study area meet the requirements to be included in the National Institute for Literacy study; thus, literacy data is not available. In conclusion, the data indicate the likelihood of LEP populations in the area.

To determine the languages of the LEP populations, Census data were consulted for project area tracts. The table below details the top five languages spoken by the total adult population (LEP and non-LEP) for each tract.

Table. Census Data: Top Five Languages Spoken by the Adult Population

Census Geographies	**Language 1**	**Language 2**	**Language 3**	**Language 4**	**Language 5**
Tracts					
Tract 4906.00 Cook County	English 93.2%	Spanish/Spanish Creole 2.3%	Tagalog 2.3%	French (Patois, Cajun) 1.8%	Korean 0.4%
Tract 4907.00 Cook County	English 96.4%	Spanish/Spanish Creole 2.1%	German 0.6%	Hebrew 0.5%	Korean 0.4%
Tract 4910.00 Cook County	English 96.9%	Spanish/Spanish Creole 2.2%	Tagalog 0.4%	French (Patois, Cajun) 0.4%	Korean 0.2%
Tract 4911.00 Cook County	English 97.7%	Spanish/Spanish Creole 1.3%	Japanese 0.4%	German 0.3%	Italian 0.2%
Tract 4912.00 Cook County	English 96.8%	French (Patois, Cajun) 1.0%	Spanish/Spanish Creole 0.9%	Tagalog 0.8%	German 0.3%
Tract 4913.00 Cook County	English 96.8%	Spanish/Spanish Creole 2.1%	French Creole 0.9%	French (Patois, Cajun) 0.3%	-
Tract 5104.00 Cook County	English 60.6%	Spanish/Spanish Creole 39.4%	-	-	-
Tract 5301.00 Cook County	English 59.5%	Spanish/Spanish Creole	Other Slavic languages	German 0.6%	Italian 0.4%

		38.9%	0.7%		
Tract 5302.00 Cook County	English 96.2%	Spanish/Spanish Creole 2.6%	Tagalog 0.7%	German 0.2%	Other Pacific Island languages 0.2%
Tract 5305.00 Cook County	English 94.3%	Spanish/Spanish Creole 2.1%	French (Patois, Cajun) 1.1%	Arabic 0.8%	German 0.6%
Tract 5306.00 Cook County	English 96.6%	Spanish/Spanish Creole 1.7%	Polish 1.0%	Russian 0.3%	French (Patois, Cajun) 0.3%
Tract 5401.00 Cook County	English 95.1%	Spanish/Spanish Creole 4.8%	Italian 0.1%	-	-
Data Source: United States Census 2000 (Table PCT10) as of February 9, 2008.					

Therefore, the tracts data does not indicate the presence of LEP language groups that exceed the Department of Justice's Safe Harbor threshold of 5% or 1,000 persons. [However, the following measures will be taken to ensure LEP persons meaningful access: enter any measures to be taken to ensure meaningful access if applicable]. Thus, the requirements of Executive Order 13166 appear to be satisfied.

Appendix B
2014–2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Environmental Justice

The refined East and West Option alignments would result in additional adverse impacts which were not discussed in this technical memorandum. These adverse impacts, which are summarized below, were reviewed to determine their effect on EJ communities.

The refined alignment along the I-57 corridor in the Roseland community area would result in adverse visual impacts and adverse impacts related to community character and cohesion for both the East and West Option. The elevated track structure along the I-57 corridor would cause adverse visual impacts because of the change in the visual setting in the highway right-of-way along the north side of I-57 in Roseland.

Considering the impacts, mitigation measures, and benefits, the East and West Options' permanent impact on community character and permanent visual impact would not be appreciably more severe or greater in magnitude than similar effects elsewhere in CTA's rail system. The mitigation measures proposed are similar in nature to those for other CTA projects and have been proposed by CTA consistently in EJ and non-EJ communities alike. The project offers substantial benefits that would accrue to the resident EJ populations. Although the alternative would still have adverse impacts on EJ communities, these impacts would not be disproportionately high or adverse. As such, no EJ-specific mitigation measures beyond those identified in the other technical memoranda would be required.

Section 1
Introduction

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to extend the existing Red Line heavy rail transit service 5.3 miles south from the existing 95th Street Terminal to Chicago's Far South Side. The proposed extension would include four new stations near 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Each new station would include bus and parking facilities.

The proposed Union Pacific Railroad (UPRR) Rail Alternative would extend the Red Line from the existing 95th Street Terminal to 130th Street. The UPRR Rail Alternative alignment would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57 for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would turn south to follow the UPRR corridor. Two options are being considered for the alignment along the UPRR corridor: the East Option and the West Option. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad right-of-way using a portion of the Norfolk Southern Railway and Consolidated Rail Corporation rights-of-ways to the terminus (end) of the RLE at 130th Street. **Figure 1** is a project overview map.

Figure 1: Red Line Extension Project Overview Map

As shown in **Figure 2**, impacts to existing parks would occur under either the East or West Option. Under the East Option, a new elevated Red Line structure would be constructed, affecting the northwest corner of Wendell Smith Park and affecting a portion of the western parcel of Block Park. Approximately 0.7 acre of Wendell Smith Park and 0.9 acre of Block Park would be affected by the East Option. Both Wendell Smith Park and Block Park would continue to provide park space to the surrounding community after implementation of the East Option, but park area would be reduced. Under the West Option, a new elevated Red Line structure would be constructed over a portion of Fernwood Parkway from 99th Street to 103rd Street between the existing UPRR tracks and Eggleston Avenue. Approximately 1.9 acres of Fernwood Parkway would be affected by the West Option. **Table 1** provides a summary of affected park area by the East and West Options.

Figure 2: Overview of Park Impacts

Table 1: Parklands Affected by UPRR Rail Alternative Options

Parkland	Address	Community Area (Ward)	East Option	West Option
Wendell Smith Park	9912 S. Princeton Avenue	Roseland (Ward 9)	0.7 acre	-
Fernwood Parkway	9501 S. Eggleston Avenue	Washington Heights (Ward 9)	-	1.9 acres
Block Park	346 W. 104th Street	Roseland (Ward 34)	0.9 acre	-
Total			***1.6 acres***	***1.9 acres***

CTA developed preliminary mitigation measures, taking into account impacts on both park acreage and the attributes, features, and amenities of each park. These mitigation measures were developed so that the result of implementation of either UPRR Alternative option would result in no adverse impact on parks after mitigation. Mitigation measures are further detailed in subsequent sections of this technical memorandum. A major feature of these mitigation measures includes developing replacement parkland in or near the community areas affected as well as replacement of any of the park attributes, features, or amenities affected by the construction of the RLE Project.

1.1 Purpose of this Technical Memorandum

Section 4(f) of the United States Department of Transportation (USDOT) Act of 1966 is a federal law that established requirements for USDOT (including FTA) consideration of publicly owned parks/recreational areas that are accessible to the general public, publicly owned wildlife/waterfowl refuges, and publicly or privately owned historic sites of federal, state, or local significance in developing transportation projects. In addition to general environmental regulations under the National Environmental Policy Act of 1966, Section 4(f) provides further protection of park resources affected as a result of major capital improvement projects.

Based on discussions with FTA and coordination with the Chicago Park District (CPD) in 2015 on park impacts and proposed mitigation measures for this project, a Section 4(f) preliminary "*de minimis*" finding was proposed for park impacts resulting from this project after mitigation proposed. A *de minimis* impact for parks, recreation areas, or wildlife/waterfowl areas is defined in 23 CFR § 774.17 as one that is determined to not adversely affect the features, attributes, or activities qualifying a property for protection under Section 4(f). The provision allows avoidance, minimization, mitigation, and enhancement measures to be considered in making the *de minimis* determination.

Concurrence from CPD as well as review and comment from the public are necessary to confirm a *de minimis* determination.

As part of the Draft Environmental Impact Statement (EIS) and Section 4(f) preliminary determinations being made, FTA recommended that CTA conduct additional coordination with CPD on the process to be followed for implementation of proposed mitigation measures and on replacement park options. The purpose of this coordination and additional analysis was three-fold:

- To demonstrate to FTA that land is available for replacement park mitigation and confirm that there would be no adverse effect findings through implementation of mitigation measures
- To conduct more detailed coordination with CPD on processes that will take place to fulfill mitigation measures
- To develop more visual and detailed ideas for public input as part of the Draft EIS and Section 4(f) public hearing

This memorandum provides documentation of CPD coordination and additional analysis of replacement park options and mitigation measures proposed to support the preliminary Section 4(f) *de minimis* impact finding.

Section 2
Summary of Park Impacts and Mitigation Proposed

The following provides a more detailed description of impacts and proposed mitigation measures. These impacts and mitigation measures served as a starting point for coordination with CPD on the process and potential replacement of parkland affected by the RLE Project. On August 17, 2015, CPD concurred with these impact findings and that impacts resulting from either the East or West Option would not be adverse after implementation of proposed mitigation measures.

2.1 Wendell Smith Park Impacts and Mitigation Measures (East Option)

The East Option alignment would run through the northwestern corner of Wendell Smith Park. Elevated track structure supports would be placed permanently in the park space. Of the 4.7 acres of the park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. Piers would be located in the park, and the bottom of the elevated structure would be approximately 15 feet above ground level.

The following attributes and features of the park are within or adjacent to the overlap area:

- **Paved Walking Path/Trees/Bench** - An existing paved walking path is maintained along the entire rectangular perimeter of the park. The westernmost north-south portion of the walking trail and a small portion of the northwestern edge of the walking path would be overlapped by the track structure. A number of small trees line the existing walking path and would be used by the overlap with tracks. In addition, there are two benches located along the westernmost north-south walking path within the overlapping area.

- **Baseball Field** - There are two baseball fields within Wendell Smith Park. The sand-filled baseball field on the northeast portion of the park is a junior-size baseball field. A small portion of the existing outfield/open space would be within the overlapped area, but would not affect the ability to use the baseball field. The second baseball field is a smaller, junior-sized baseball field in the southwest corner of the park. This smaller junior baseball field contains a backstop and bench. Because of the proposed overlap area, the backstop, bench, and space behind this backstop would be used.

Mitigation measures proposed for Wendell Smith Park include the following:

- Replacement of lands used (acreage) with lands of reasonably equivalent usefulness and location and of at least comparable value. The replacement land would be used to construct new park space in or near the Roseland community area to enhance park land availability for the surrounding community. New park area created through this replacement acreage would be constructed in accordance with CPD standards and facilitate CPD master planning goals and objectives.

- Reconstruction of the two smaller junior-sized baseball field facilities within Wendell Smith Park to provide one larger baseball field facility in this park. This mitigation measure was developed based on coordination with CPD to ensure that the attributes, features, and activities within the park are not adversely affected as a result of this option and this measure would enhance existing baseball facilities and activities within the park. Additional outreach to the public will be conducted to share concepts for replacement proposed within Wendell Smith Park and receive further input.

- Relocation and replacement of the smaller, junior-sized baseball field on replacement park land based on coordination with CPD and outreach to the public so that the attributes, features, and activities are not adversely affected by the use of the northwest corner of the park.
- Replacement and relocation of facilities affected by the project including sidewalks, paths, benches, trees, and other facilities within the park.
- Restoration and landscaping of disturbed areas.
- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

2.2 Block Park Impacts and Mitigation Measures (East Option)

The East Option alignment would run through the west parcel of Block Park, and the elevated structure and its associated clearances would overlap 0.9 acre of park space. Elevated track structure supports would be placed permanently in the west parcel of the park space. An auxiliary station entrance would also be located in the park, along the western edge of the existing parcel. The affected parcel includes an isolated portion of the park's open space and a communications tower, and does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the east parcel of the park.

Mitigation measures proposed for Block Park include the following:

- Replacement of lands used (acreage) with lands of reasonably equivalent usefulness and location and of at least comparable value. The replacement land would be used to construct additional new park space in or near the Roseland community area to enhance park land availability for the surrounding community. New park space created through this replacement acreage would be constructed in accordance with CPD standards and facilitate CPD master planning goals and objectives.
- Restoration and landscaping of disturbed areas.
- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

- While not related to the attributes, features, or activities of the park, additional mitigation measures would include coordination with the City of Chicago regarding relocation of the communications tower.

2.3 Fernwood Parkway Impacts and Mitigation Measures (West Option)

The West Option track structure would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets. Elevated track structure supports would be placed permanently in the parkway. Approximately 1.9 acres of the parkway would be overlapped by the elevated structure and its associated clearances. The parkway functions as open space, and does not contain recreational amenities.

Mitigation measures proposed for Fernwood Parkway include the following:

- Replacement of lands used (acreage) with lands of reasonably equivalent usefulness and location and of at least comparable value. The replacement land would be used to construct replacement park space in or near the Washington Heights community area to enhance park land availability for the surrounding community. New park space created through this replacement acreage would be constructed in accordance with CPD standards and facilitate CPD master planning goals and objectives.

- Potential installation of a new bicycle path beneath the elevated track structure. This new bicycle path would be subject to use by CTA for track structure maintenance. While this mitigation measure is not related to the attributes, features, or amenities within the existing park, this measure would enhance the existing unused green space and better connect parks and the newly proposed transit infrastructure. A preliminary analysis as part of the Draft EIS confirmed the feasibility of this bicycle path. Additional coordination with the City of Chicago Department of Transportation will confirm the feasibility of this measure.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the green space but not adversely affect the safety of the transit facility.

2.4 Chicago Park District Coordination

CTA held early coordination meetings with CPD on April 18, 2011; July 23, 2013; May 8, 2014; and April 8, 2015 to provide CPD staff with preliminary information on the RLE Project, purpose and need, identification and refinement of alternatives, and potential impacts on parks, and to discuss potential mitigation measures.

On June 8, 2015, CTA provided CPD with information on park impact findings and proposed mitigation measures. On August 17, 2015, CPD provided its concurrence that after implementation of the proposed mitigation measures there would be no adverse impact on parks from either option under evaluation for the RLE Project.

After discussions with FTA in fall 2015, CTA and CPD held additional coordination meetings to further refine mitigation measures and processes to be followed in fulfilling mitigation requirements:

- **October 8, 2015:** CTA and CPD coordination meeting to review scope of work for further developing park mitigation measures and to outline coordination steps and schedule.
- **March 10, 2016:** CTA and CPD coordination meeting to review field investigation findings and confirm 12 potential replacement park sites for further analysis.
- **April 6, 2016:** CTA and CPD coordination meeting to discuss replacement park suitability analysis findings and to further refine 3 potential replacement park options for development of site plans.
- **May 18, 2016:** Joint meeting with CTA, CPD, and the City of Chicago Department of Planning and Development (DPD) to review the proposed 3 replacement park site options; city-owned property, land uses, and other city-owned infrastructure potentially affected by the project and/or proposed as part of the 3 potential replacement park sites; and to understand any other DPD-related planning and/or economic development initiatives in the area.
- **June 15, 2016:** CTA and CPD coordination meeting to review draft replacement park option concept plans and replacement of affected amenities within Wendell Smith Park.

The coordination meetings held in late 2015 and 2016 helped to further identify and agree upon appropriate replacement of amenities within Wendell Smith Park and potential new replacement park options to share with the public for further input. CTA worked with landscape architects, park planners, and other urban planners to develop potential replacement park sites and replacement of amenities within Wendell Smith Park. Meeting notes from these meetings and correspondence between CTA and the Chicago Park District are provided in **Attachment 1** of this technical memorandum.

These coordination meetings also helped to solidify key considerations for replacement park options, and developed a more detailed understanding of how mitigation measures would need to be implemented:

- CPD requested that CTA focus replacement park options on sites that could accommodate a new park rather than developing smaller green space or pocket park sites.
- CPD requested that new park options meet CPD standards for new park size. All new CPD parks are required to be 2 acres in size or greater. Mitigation measures proposed to address impacts from implementation of the RLE Project will ensure replacement of the acreage of

identified park impacts (1.6 and 1.9 acres for the East and West Options, respectively). The investigation to identify potential replacement park sites focused on sites that would be a minimum of 1.6 or 1.9 acres in size, with preference given to sites that allowed for 2 acres or more of replacement park.

- CPD requested that replacement park options be near the project area and affected community and support CPD's agency goals and objectives of providing parks within a ½-mile radius of all residents in Chicago. Priority for replacement park options was therefore given to sites that would be located near affected parks and/or to sites that helped fill a current gap in park sites within these community areas.

- CPD will require CTA and FTA to conduct a Phase I Environmental Site Assessment (ESA) before purchase of property to confirm any existing or potential environmental contamination liabilities.

    - As part of this current analysis within the Draft EIS, CPD agreed that information and analysis contained in the environmental database search report prepared by Environmental Data Resources, Inc. (EDR) would provide a sufficient level of detail to evaluate replacement park options. EDR reports are a standard tool used to identify historic or existing environmental concerns, and are usually a first step in a Phase I ESA.

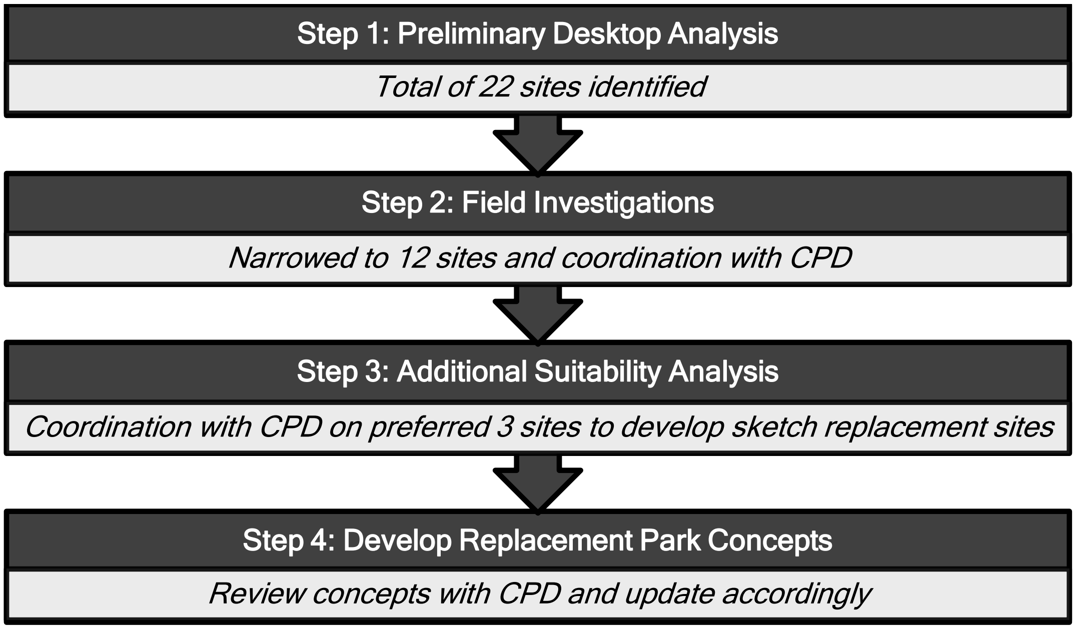
    - Once a single option is chosen for the RLE Project and a potential replacement park option is confirmed, CTA and FTA will conduct the Phase I ESA before acquisition of land. Clean up of any hazardous materials identified will be addressed by CTA and FTA such that the site is in suitable park condition when turned over to CPD for building the replacement park.

- CPD will consider public comments received as part of the RLE Project in further development of replacement parks and amenity needs. Only amenities identified in the mitigation requirements as part of the RLE Project should be included in concepts at this time.

Coordination with CPD will continue through the Final EIS to finalize replacement park options and other mitigation measures.

Section 3
Replacement Park Identification Process

A four-step, iterative process was developed to identify potential replacement park sites, as shown in **Figure 3**. This process allowed the project team to first identify as many potentially eligible properties as possible and continue to narrow sites using professional judgment and suitability criteria, in coordination with feedback from CPD staff.



Step 1: Preliminary Desktop Analysis
Total of 22 sites identified
Step 2: Field Investigations
Narrowed to 12 sites and coordination with CPD
Step 3: Additional Suitability Analysis
Coordination with CPD on preferred 3 sites to develop sketch replacement sites
Step 4: Develop Replacement Park Concepts
Review concepts with CPD and update accordingly

Figure 3: Replacement Park Identification Process

CTA and CPD agreed that given the timeline of the potential acquisition of replacement park property and the need for additional public input into the process, it was best to narrow the potential sites to the top three ranked sites analyzed and develop conceptual site plans for each.

The following sections provide additional details on each of the steps conducted.

3.1 Desktop and Geospatial Analysis

A desktop and Geographic Information Systems (GIS) analysis was conducted first to identify potential park sites. As noted earlier, the preliminary focus for identification of potential park sites was two-fold: to identify potential sites that would provide acre-for-acre replacement park of affected parkland from the RLE Project (1.6 acres for the East Option or 1.9 acres for the West Option), and to meet CPD standards for new park acreage (at least 2 acres).

In addition, CTA considered the following priorities for the East Option:

- Ability to replace total acreage affected

- Ability to replace park within Roseland community area

- Ability to accommodate a new junior-sized baseball field to address impacts on the existing junior-sized baseball field in Wendell Smith Park. This included a review of nearby existing parks with available open space for a new junior-sized baseball field as well as a review of properties with the potential for inclusion of a new junior-sized baseball field.

CTA considered the following priorities for the West Option:

- Ability to replace total acreage affected

- Ability to replace park within Washington Heights community area or adjacent community area (Fernwood Parkway south of I-57/I-94)

The initial analysis consisted of visual desktop inspections and further review in the field.

The GIS analysis identified available vacant properties for potential park sites using four main data sources: (1) City-owned vacant properties database, (2) City of Chicago database on 311 calls regarding open and vacant buildings, (3) vacant and abandoned building violations, and (4) Chicago Metropolitan Agency for Planning (CMAP) 2010 land use inventory of vacant properties. CTA evaluated parcels within ½-mile, 1-mile, 2-mile, and 3-miles of potential park impacts.

City-owned vacant parcels were identified as having the greatest potential for potential park sites given the anticipated ease of working between agencies to acquire land. In addition, identifying vacant and abandoned properties provided the project team with information on potentially underinvested lands near the project area where development of parks might provide additional amenities to the community area and/or incentivize additional investment.

The primary criteria for the desktop and GIS analysis were to identify contiguous vacant properties totaling 1.6 acres or greater, location near the affected parks, distance from other existing parks where replacement of acreage might help enhance existing parks, and adequate layout for a junior-sized baseball field (for East Option only).

A total of 22 sites were identified as part of the desktop and GIS analysis. **Figure 4** shows the 22 site locations that were identified as part of the desktop analysis for further field identification. These sites were located in 17 main areas; because some areas contained multiple site options, some sites were identified as “A”, “B,” or “C.” In addition, Gano Park (an existing park just north of sites 14 and 15 on **Figure 4**) was identified as an existing park that might have an appropriate layout to allow for a junior-sized baseball field.

9B	1.9	112th Street/State Street	Roseland/Ward 9
10	6.0	Adjacent to Major Taylor Trail	Morgan Park/Ward 34
11	5.9	115th Street/State Street	West Pullman/Ward 9
12	2.2	Michigan Avenue/Kensington Avenue	West Pullman/Ward 9
13	0.9	118th Street/Michigan Avenue	West Pullman/Ward 9
14	1.7	119th Street/Racine Avenue	West Pullman/Ward 34
15	3.9	119th Street/Morgan Street	West Pullman/Ward 34
16	1.5	Michigan Avenue/120th Street	West Pullman/Ward 9
17	1.9	120th Street/Halsted Street	West Pullman/Ward 34

One important note regarding the desktop and GIS analysis findings is that no potential park sites were identified within the Washington Heights community area, although there are already several parks in this community area, particularly north of I-57. While initial GIS investigations identified several vacant properties in Washington Heights, the properties were not large enough nor contiguous to support a new park. A bike and pedestrian path along 89th Street between Loomis Street and Vincennes Avenue was considered early in the analysis, but based on coordination with CPD, the site would not serve as park acreage replacement or be manageable by CPD; as such, it was removed from consideration. One vacant property of suitable size was identified between 89th and 90th Streets, but is not contiguous and is separated by Loomis Street. Use of this site would require additional, costly roadway reconfigurations; therefore, this site was eliminated. **Attachment 2** provides aerials of these considered but eliminated sites.

While the West Option would impact Fernwood Parkway in Washington Heights, the area of impact within Fernwood Parkway is south of the I-57. This area, while technically designated as within Washington Heights, is more associated with the nearby Roseland community area to the south (i.e., both are south of the interstate and share similar surrounding land uses and community character). Based on discussions with CPD, it was agreed that reviewing sites within 1 mile of the area of impact (south of I-57) would be preferable.

3.2 Field Investigations

CTA conducted field investigations on February 17 and 18, 2016 to further analyze the 22 potential sites as well as to evaluate the potential to provide a replacement baseball field in Gano Park. **Attachment 3** provides field visit findings and detailed considerations for all sites.

Of the 22 sites reviewed, 10 sites were eliminated based on the field investigations (Sites 1, 2A, 2C, 3A, 4, 5, 8B, 13, 14, and 16). Primary reasons for elimination were because of the following:

- Insufficient size (would not meet the minimum 1.6 and 1.9 acres affected by either the East or West Option, or CPD's standard of a minimum of 2 acres)
- High noise levels, safety concerns because of compromised views, or location near heavily traveled streets
- Non-contiguous parcels (would require parks on both sides of a roadway or would require major street reconfigurations to provide a continuous park space; not preferable for cost, safety, and park layout)
- Active use parcels determined to be difficult to purchase given their location and current land uses

The field investigation at Gano Park determined that the available grassed area in this park would be unsuitable for a baseball field replacement for several reasons: (1) an existing retention basin makes the site unsuitable for active recreation, (2) the available area would not be sufficient to accommodate a junior-sized baseball field, (3) there already is a baseball field in this park, and (4) this park would be a substantial distance from the community area where park impacts would occur.

3.3 Suitability Analysis

After the field investigation, 12 sites remained for further suitability analysis. Eight of these 12 sites (Sites 2B, 9A, 9B, 10, 11, 12, 15, and 17) were determined to be available for use as a replacement park site for either the East or West Option. Four of these 12 sites (Sites 3B, 8A, 6, and 7) were determined to be feasible options for the East Option only.

The 12 sites fell into one or more of three main categories that were initially determined to be favorable for park siting:

- Adjacent to proposed RLE Project (alignment or stations)

- Underutilized/vacant commercial areas (transit-oriented development opportunity areas)
- Providing connections to Major Taylor Trail or existing parks

Additionally, some sites were identified within the Morgan Park and West Pullman community areas but would be further from the project area. These sites were retained for the suitability analysis given other favorable factors at these locations, including larger sizes of available land and ability to co-locate parks with existing Metra rail, existing parks, trail systems, or community facilities such as senior centers.

CTA conducted a suitability analysis using six areas of consideration (see **Figure 5**). Each park was assigned a low, medium, or high rating (values of 1, 3, or 5, respectively) based on a qualitative and quantitative assessment of the criteria.

Location

- Distance from area of impact
- Distance from proposed stations or from other major park/trail systems
- Ability to serve an area currently not served by parks (no existing parks within 1/2-mile buffer of residents)

Ownership/ Availability

- Current vacant/abandoned or for sale properties
- City-owned property availability
- Ability to combine multiple parcels

Surrounding Land Uses/Zoning Compatibility

- Adjacent use of residential/commercial/ schools
- Best and highest uses (economic uses versus park/recreational uses)

Safety and Security

- Visibility and clear views for police scrutiny/public safety
- Emergency access/response ability

High-Level Cost Considerations

- Need for building acquisitions/demolition
- Need for street relocations, relocation of cell towers or other facilities

Environmental Factors

(EDR Findings)

- Federal, state, local environmental database listings
- Historical site uses and adjacent site uses
- Overall potential for contamination requiring remediation or gaps in available data to determine potential for contamination

Figure 5: Suitability Analysis Criteria

CTA evaluated sites using GIS based on their distance from the area of impacts, distance from proposed stations and other major trail systems or existing parks, and the ability for sites to fill existing gaps in park access. Existing gaps in parks were identified by placing a ½-mile buffer around existing parks to determine areas where parks were located more than ½-mile from residents. Based on coordination with CPD, sites that could fill existing gaps within communities were given extra points, while sites that were already under consideration for other park projects received negative points.

CTA consulted the City-managed property owner databases to identify land ownership, with additional weight given to properties that are currently vacant and/or City-owned because City-owned properties would be easier to acquire. Property title information was used to supplement this analysis.

CTA also reviewed land use and zoning for the sites and the properties surrounding them. Additional points were given to sites that could serve as catalysts for additional development by providing attractive park spaces within underdeveloped areas. Ranking consideration took into account whether park uses would provide the highest and best use of the property given land use and zoning both on the property and adjacent properties.

Safety considerations included a review of sites for clear views for police monitoring, street access issues, or issues that could arise in providing emergency access.

CTA also evaluated high-level cost considerations including whether costly street relocations or configurations would be needed. CTA also considered whether properties were already open space or if demolition would be needed, adding to costs for implementation.

Finally, CTA reviewed EDR report findings to evaluate the risk of encountering hazardous materials at each site. The EDR report provided historical site uses (Sanborn maps and aerial photographs) and a summary of site listings in environmental databases, which could indicate the presence of hazardous materials on the property. The EDR report would be one part of the Phase I ESAs that would be performed as part of property acquisition, and provides information related to environmental fatal flaws.

Attachment 4 contains additional details on considerations for each site on each of the six criteria. **Attachment 5** contains a summary of information from the EDR report.

Table 3 provides a summary matrix of the suitability analysis scoring. CTA reviewed the top three ranked sites with CPD and based on coordination, these three sites were selected for further development of replacement park concept plans.

Table 3: Site Suitability Analysis Summary

Criterion	2B	3B	6	7	8A	9A	9B	10	11	12	15	17

Note: Total scoring in red text indicates the top three ranked sites (Sites 2B, 8A, 12).

Section 4
Replacement Park Concepts

Based on the suitability analysis and coordination with CPD, three potential replacement park sites (sites 2B, 8A, and 12) were identified as the best candidate sites; CTA developed conceptual plans for public review and comment for those three sites. CTA reviewed the initial park concepts provided in this section with CPD and updated them based on CPD's comments. Based on public input on potential replacement park sites, the Final EIS will indicate public preference for the replacement park location.

All property needed for these replacement park sites would be voluntarily acquired from willing sellers. No eminent domain takings are proposed to fulfill the mitigation measures for new replacement park locations.[1] While some replacement parcels are City-owned property, additional outreach to private property owners would be conducted during the Final EIS (closer in time to when the property would be acquired) to confirm whether property can be purchased. If a property owner is not willing to sell a subject property, which is identified as an optional site for replacement park and is needed to fulfill mitigation requirements, other replacement park sites will be pursued. If none of the properties identified for replacement park in the EIS can be voluntarily acquired, CTA and CPD will coordinate further to identify potential sites using similar analysis and process and most up to date property availability data to confirm available replacement park sites. The feasibility of acquiring replacement park locations and process to be followed by CTA, CPD, and property owners in fulfilling replacement park mitigation will be documented in the Final EIS to ensure implementation of mitigation measures and confirm environmental findings. No property acquisition would occur until after the NEPA environmental phase is completed (i.e., when FTA issues a Record of Decision for the Final EIS).

4.1 Replacement Option Site 2B

The replacement option for Site 2B is located along Michigan Avenue near 101st Street and could serve as a 2.1- to 2.2-acre new replacement park appropriate for either the East or West Option. The site is approximately ¾-mile from the proposed RLE corridor and would fulfill an existing gap in park facilities in this community area. **Figures 6, 7, and 8** show existing park conditions as well as two park concepts for this site.

Concept 1 for this site would include passive park space with a walking path, trees, and landscaping. CTA would purchase existing vacant land for this to provide this park. All acquisition would be based on the ability to voluntarily acquire property from property owners.

---

[1] It is important to note that there is a difference between a taking under eminent domain for the RLE Project itself (right-of-way needs for the new transportation facility proposed) and what is proposed for the replacement park sites, which would be a voluntary acquisition from property owners. Voluntary acquisition from willing sellers is proposed for replacement park sites such that mitigation measures proposed do not cause additional environmental impact from the RLE Project.

Concept 2 for this site would include voluntary acquisition of vacant property and require voluntary acquisition of one active use parcel on Indiana Avenue. Voluntary acquisition of this active use parcel would provide adequate space for a junior-sized baseball field, approximately 175 feet in diameter from home plate to the center field pocket. Other amenities, such as walking path, landscaping, and trees would be similar to those proposed for Concept 1.

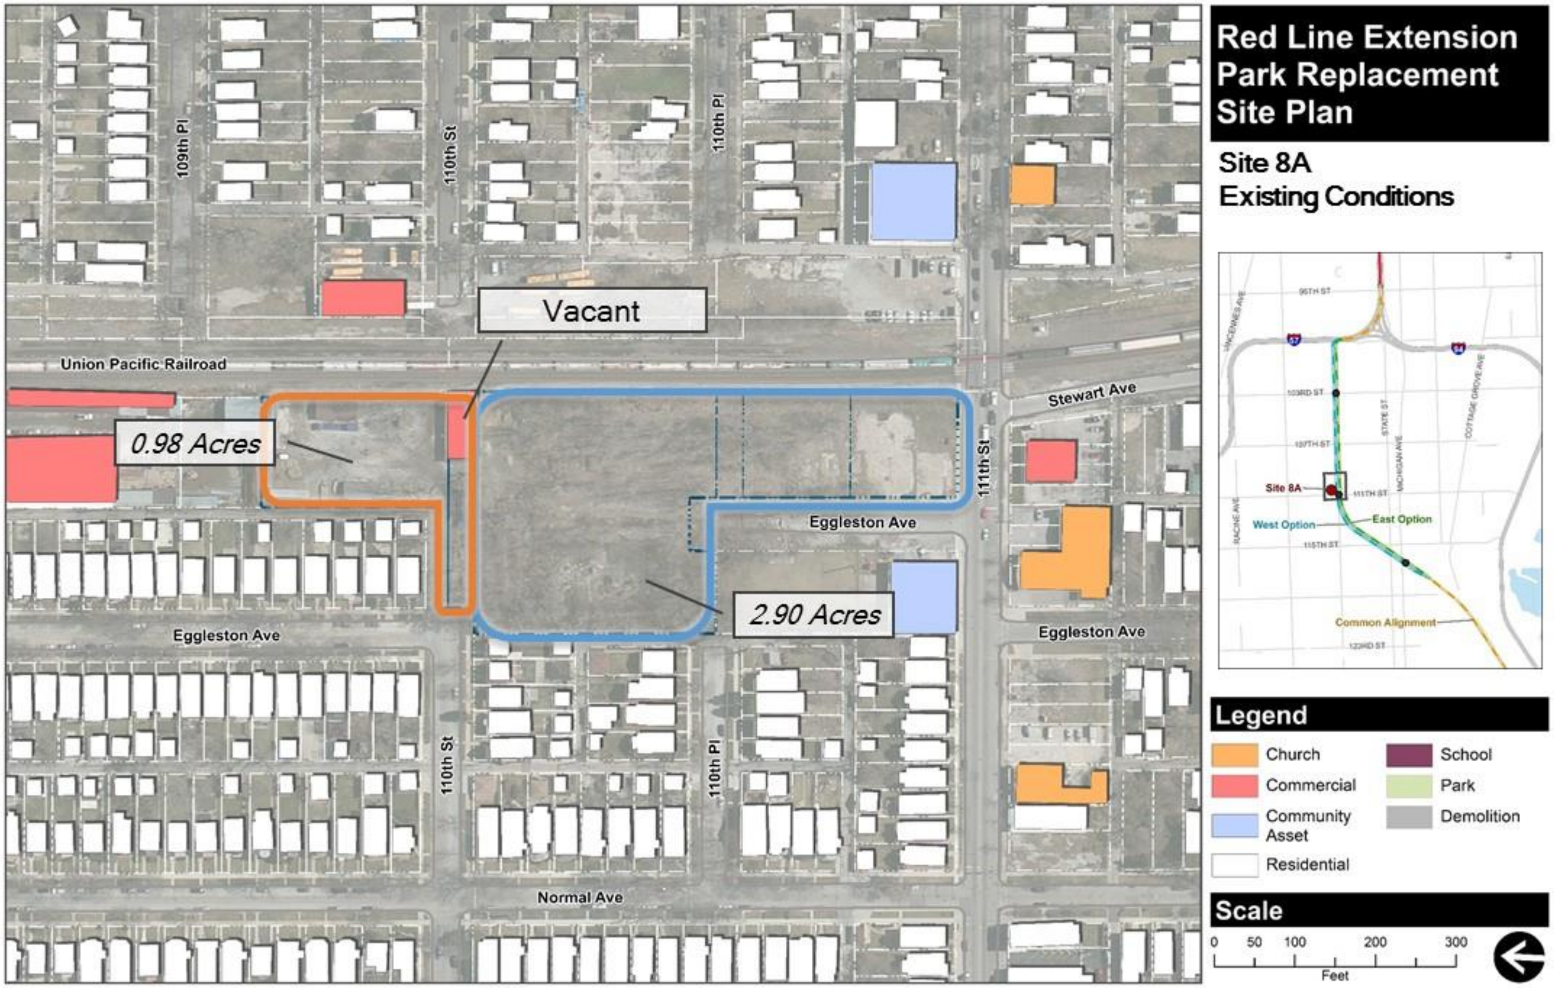
- Inclusion of ballfield is dependent on **voluntary acquisition** of one active use residential property (pending CPD confirmation of ballfield impact) - parcel **is not** a proposed taking as part of the Red Line Extension project
- Full residential parcel to be converted to park space
- Field Dimensions: 175 ft. from home plate to center field pocket
- Park Area: 2.2 Acres

Figure 8: Site 2B Park Concept 2

4.2 Replacement Option Site 8A

The replacement option for Site 8A is located along 111th Street near Eggleston Street and is adjacent to the proposed elevated track structure and 111th Street station. This site could serve as a 2-acre new replacement park for the East Option only. A park & ride facility is proposed on a portion of this site as part of the East Option. This site would not be large enough to be a replacement park under the West Option because a park & ride facility is proposed at this site. This site is within ½-mile of Wendell Smith Park and Block Park. **Figures 9 and 10** show existing conditions as well as a replacement park concept for this location.

The concept for this site would allow for co-location of the new park with a new park & ride surface lot. A junior-sized baseball field, approximately 175 feet in diameter from home plate to the center field pocket, would be provided on the north side of the parcel. This site would involve voluntary acquisition of vacant property to accommodate the new park as well as acquisition of City-owned property for the park & ride lot. This site would provide additional connectivity between the new replacement park and nearby community facilities (a youth center and the Agape Community Center).



Red Line Extension Park Replacement Site Plan

Site 8A (East Option) Park Replacement Concept

- Plans and Profiles calls for 145 park and ride spaces - 150 spaces shown
- Concept shown is dependent on **voluntary acquisition** of one active use commercial property - parcel **is not** a proposed taking as part of the Red Line Extension project
- Replacement parking provided for youth center southwest of site
- Field Dimensions: 175 ft. from home plate to center field pocket
- Park Area: 2.0 acres
- An emergency access buffer of up to 14 feet from edge of track is required by CTA

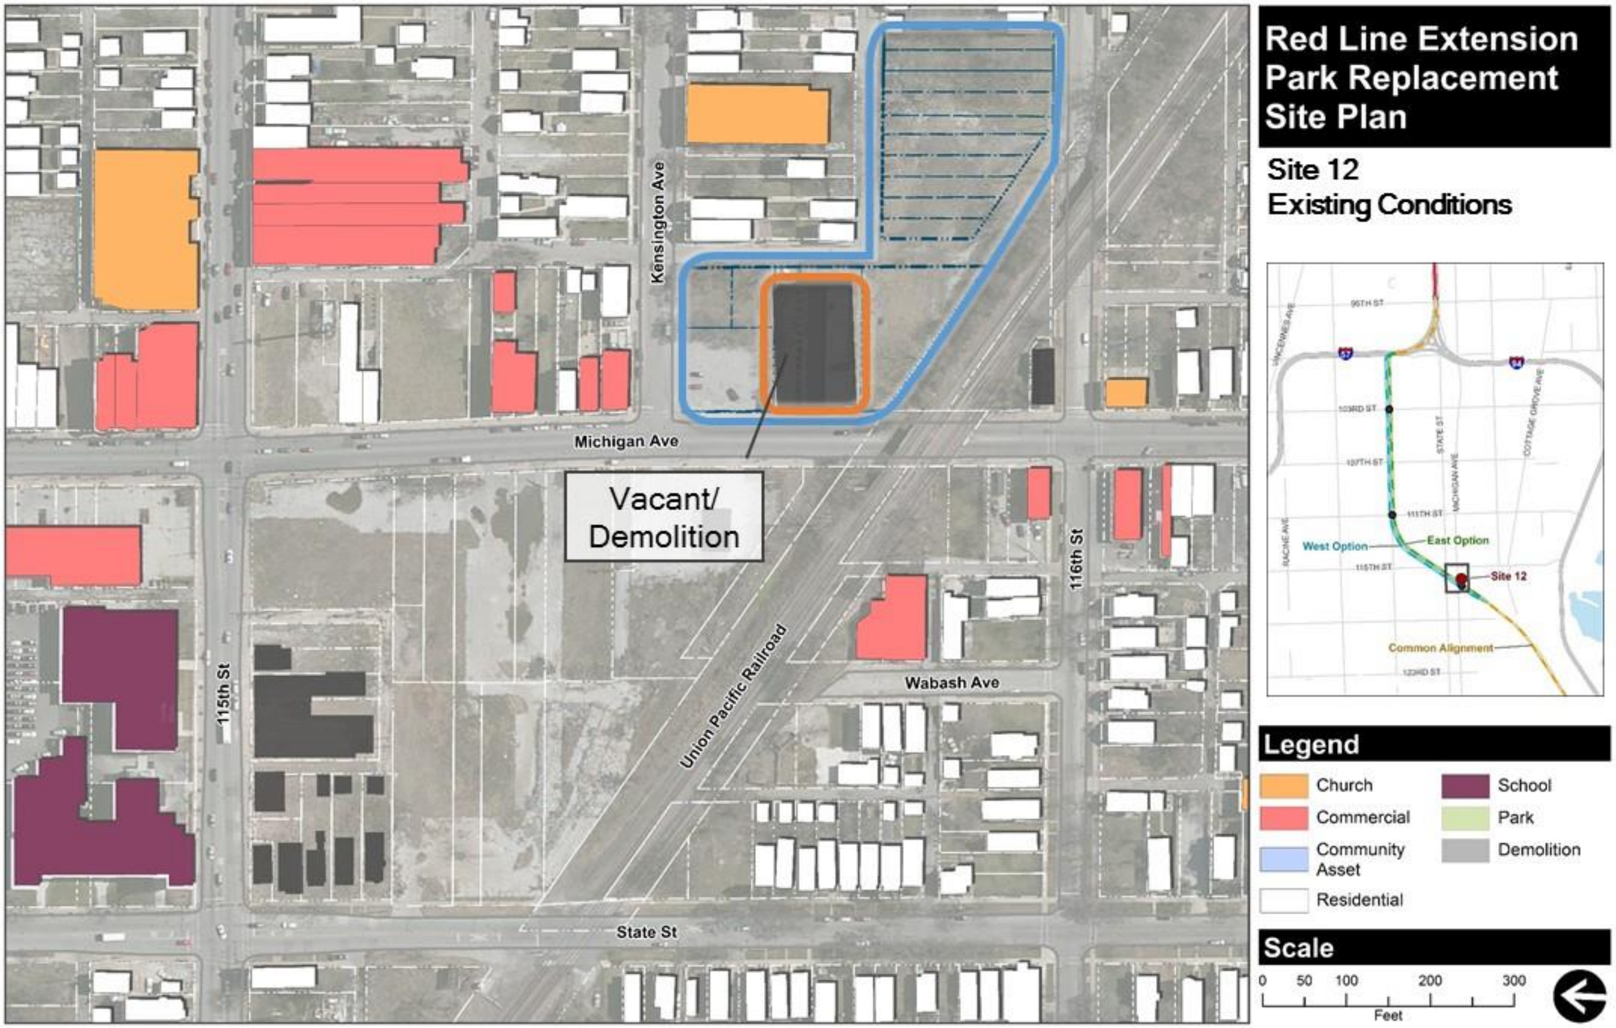
Figure 10: Site 8A Park Concept

4.3 Replacement Option Site 12

The replacement option for Site 12 is located along Michigan Avenue near Kensington Avenue and adjacent to the proposed elevated track structure and Michigan Avenue station. This site could serve as a 2.4-acre new replacement park for either the East or West Option. **Figures 11, 12, and 13** show existing conditions and proposed concept plans for this site under both the East and West Options.

Under the East Option, two park & ride lots are proposed near Michigan Avenue station. A 175-space surface parking lot is proposed northeast of the tracks, and a three-story parking garage accommodating 825 parking spaces is proposed southwest of the tracks. Under the East Option park concept, all 1,000 parking spaces would need to be provided on the southwestern parcel so that the northeastern parcel could be used for the park. This park concept would be adjacent to the proposed Michigan Avenue station and would allow for co-location of the new park with the new proposed transit facility. Voluntary acquisition of the northeastern parcel would be used under this concept.

Under the West Option, one five-story garage with 1,000 parking spaces is proposed on the southwest side of the tracks (no changes to the proposed parking would occur). This park concept would be adjacent to the proposed Michigan Avenue station, within walking distance. Voluntary acquisition of property on the southwestern parcel would be used under this concept.



Red Line Extension Park Replacement Site Plan

Site 12 (East Option) Park Replacement Concept

- Accommodating all proposed park n ride spaces in the parking garage creates space for a park in the northeast lot
- Field Dimensions: 175 ft. from home plate to center field pocket - a smaller 125-ft. field may be considered to provide space for a backstop and a buffer between outfield and walkway
- Park Area: 2.0 Acres
- An emergency access buffer of up to 14 feet from edge of track is required by CTA - pedestrian walkway north of station on CTA property would also serve as emergency access lane per discussions with CPD

Section 5
Changes to Existing Parks

5.1 Wendell Smith Park - Amenities Replacement

The West Option would avoid use of Wendell Smith Park and would not have permanent impacts to the park. The East Option would impact Wendell Smith Park; specifically, the East Option would impact one junior-sized baseball field, which is the smaller of the two baseball fields as well as the walking path, benches, and landscaping. Mitigation measures are proposed so that the attributes, features, and activities of the park are not adversely affected and include replacement of these amenities within Wendell Smith Park as well as replacement park acreage with new parkland (potential sites for this replacement park are provided in Replacement Park Concepts above). **Figures 14 and 15** provide conceptual views of the RLE alignment for the East and West Option, respectively. **Figure 16** provides a conceptual plan for replacement of affected amenities within Wendell Smith Park should the East Option be selected.

Replacement within Wendell Smith Park would include the following:

- Replacement and re-routing of the walking path within Wendell Smith Park. A fence dividing the elevated rail structure from the park is a preliminary recommendation based on coordination with CPD.

- Replacement of benches and landscaping, including trees along the re-routed walking path.

- Replacement of the affected smaller junior-sized baseball field with a complete replacement of the existing baseball field amenities by providing one larger baseball field. This larger baseball field was recommended based on coordination between CTA and CPD to enhance activities and amenities of the park.

A new junior-sized baseball field of similar size would be constructed at another site if the East Option were selected. Concepts for the new junior-sized baseball field are shown in **Section 4** of this report.

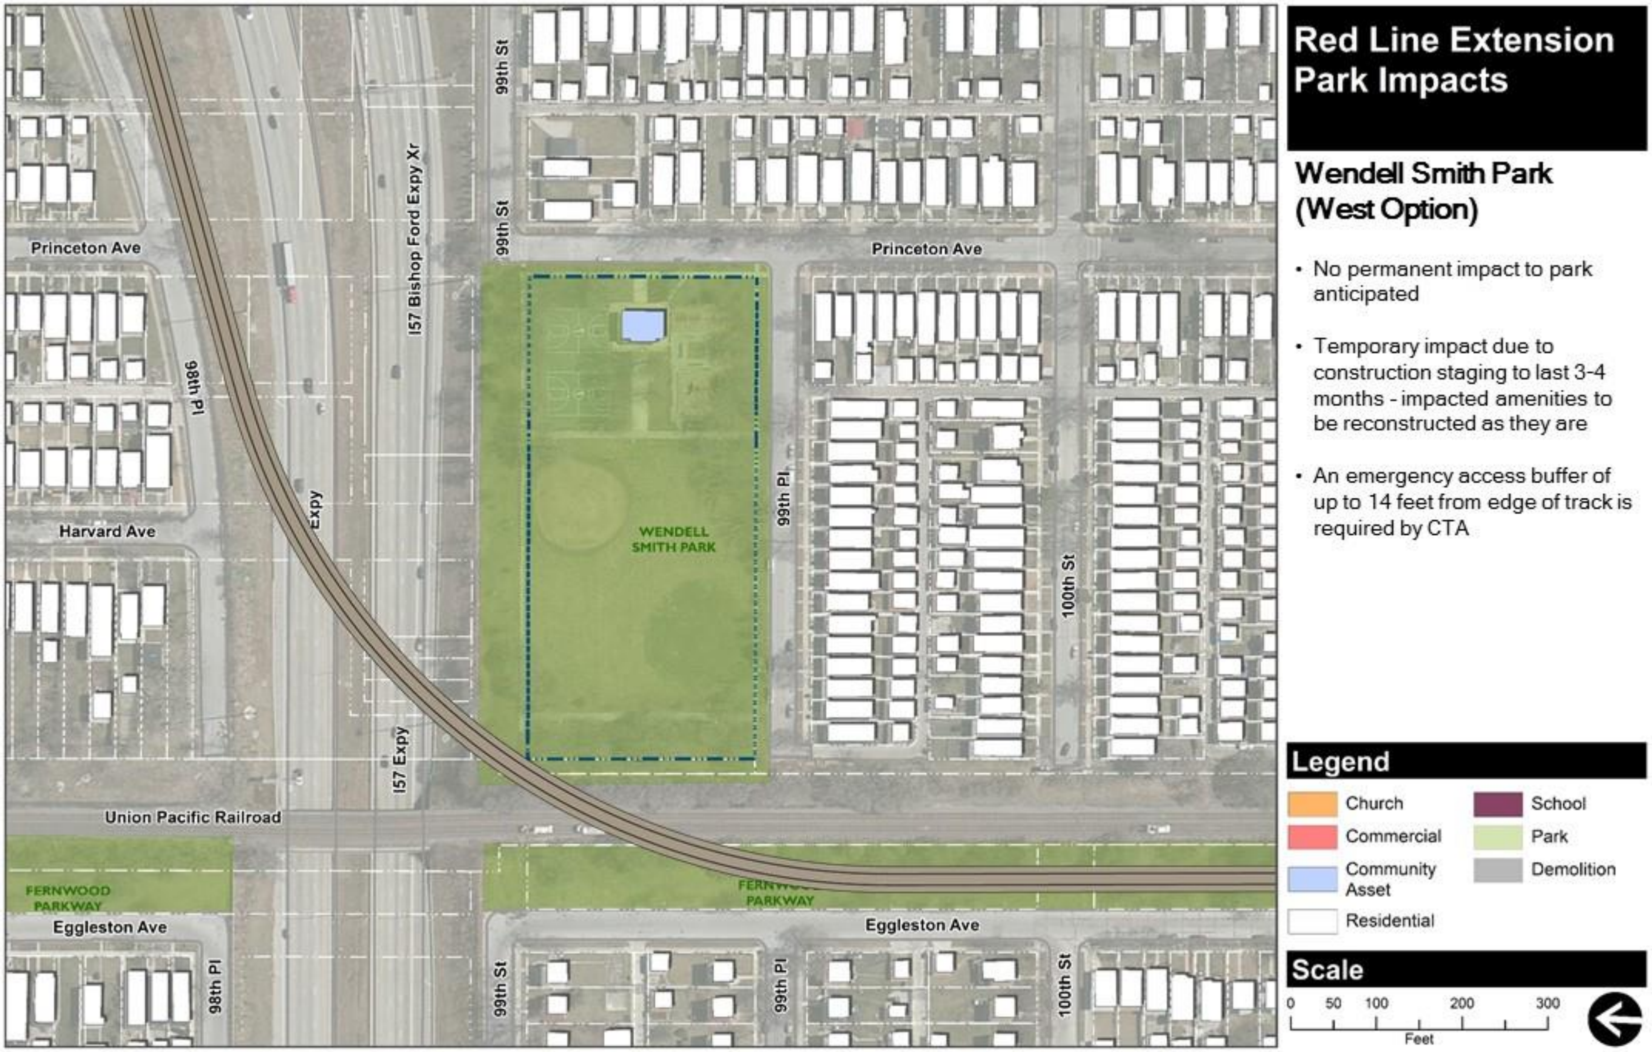
Red Line Extension Park Impacts

Wendell Smith Park (East Option)

- Approximately 0.7 acre would be permanently impacted by the East Option alignment
- One youth size ballfield would be impacted - national standards vary between 125 ft. and 175 ft. between home plate and center field pocket
- The proposed structure is elevated -pedestrian circulation and passive uses remain possible
- Temporary impacts to other park amenities are likely during construction staging
- An emergency access buffer of up to 14 feet from edge of track is required by CTA

Figure 14: East Option Alignment near Wendell Smith Park



Red Line Extension Park Impacts

Wendell Smith Park (West Option)

- No permanent impact to park anticipated
- Temporary impact due to construction staging to last 3-4 months - impacted amenities to be reconstructed as they are
- An emergency access buffer of up to 14 feet from edge of track is required by CTA

Figure 16: Wendell Smith Park Concept (East Option)

5.2 Block Park

Under the East Option, there would be impacts to Block Park. **Figure 17** shows how the East Option would impact the park. Mitigation measures would include replacement of the affected acreage of the park with new parkland, as described in the Replacement Park Concepts above.

Block Park is divided into two parcels by Harvard Avenue, which provides emergency access for the nearby fire station. As part of the East Option, the western parcel would be used by the proposed elevated track structure and 103rd Street station. There are currently no park amenities on the western parcel. The eastern parcel, where park amenities are currently provided, would not be used as part of the RLE Project; the eastern parcel would continue to function as a park.

Mitigation measures for impacts on this property would also include restoration and landscaping of disturbed areas and incorporation of design features, where necessary, to reduce or minimize impacts. Features would be designed such that they would enhance the park but not adversely affect the safety of the transit facility.

Red Line Extension Park Impacts

Block Park (East Option)

- Approximately 0.9 acres would be impacted by the East Option alignment
- The proposed structure is elevated -the west parcel of Block Park, which is impacted by the alignment, may still be used for passive uses and circulation for pedestrians will remain available
- An emergency access buffer of up to 14 feet from edge of track is required by CTA

Figure 17: East Option Alignment near Block Park

5.3 Fernwood Parkway

Under the West Option, there would be impacts to Fernwood Parkway. **Figures 18 and 19** show how the West Option would impact the park. Mitigation measures would include replacement of the affected acreage of the park with new parkland, as described in the Replacement Park Concepts above.

As part of the West Option, approximately 1.9 acres of Fernwood Parkway would be used to accommodate the proposed elevated track structure and 103rd Street station.

Mitigation measures for impacts on this property would also include restoration and landscaping of disturbed areas and incorporation of design features, where necessary, to reduce or minimize impacts. Features would be designed such that they would enhance the park but not adversely affect the safety of the transit facility.

In addition, because the area beneath the proposed elevated structure within Fernwood Parkway is large, there is the potential to provide a bicycle path along this affected area and near the proposed 103rd Street station. Additional coordination with the Chicago Department of Transportation, who is responsible for implementation of the bicycle program in Chicago, will be conducted to determine final feasibility of this bicycle path.

Section 6
Conclusions

The purpose of the Section 4(f) additional park analysis was to fulfill three main goals, as described above. Based on the findings detailed within this report, the following have been accomplished as part of this additional analysis for the Draft EIS:

- The analysis demonstrates that land is available for the proposed replacement park mitigation. CTA initially identified 22 potential sites. Based on continued coordination with CPD in further developing park concepts and processes for implementing mitigation measures, there would be no adverse effects after implementation of these measures. Park space and amenities in these community areas would be enhanced by implementation of replacement parkland and more active park uses.

- CTA coordinated with CPD to outline processes for implementation of these mitigation measures. After public comment on replacement park concepts as part of the Draft EIS, as part of the Final EIS a preferred replacement park option will be identified based on public comments. Property acquisition is not permissible before completion of Final EIS and the final replacement park location will be confirmed with property owners and CPD following completion of the NEPA process. Further environmental analysis in the form of a Phase I ESA will be conducted as part of property acquisition and before construction of the RLE Project.

- CTA developed park concepts at three sites as well as a site concept for replacement/relocation of amenities within Wendell Smith Park. This information will be useful in obtaining meaningful public input on park impacts and mitigation proposed as part the Draft EIS and Section 4(f) public hearing.

The next step for coordination on park impacts is to provide information from this analysis and the Draft EIS to the public for comment as part of the public hearing on the RLE Project Draft EIS and Section 4(f) Analysis. Based on public comments received on the environmental impacts and mitigation measures proposed, FTA and CTA will select a preferred UPRR option to move forward into a Final EIS.

CTA will continue to coordinate with CPD and other agencies throughout the next stages of this process. It is anticipated that a preferred replacement park site will be identified as part of the Final EIS. Additional coordination with property owners for voluntary acquisition of land will occur following completion of the environmental phase of this project. Once property is acquired, additional environmental site assessment in the form of a Phase I ESA will be conducted before construction.

Mr. Rob Rejman
Director of Planning and Construction
Chicago Park District
541 N. Fairbanks Court
Chicago, IL 60611

Re: CTA Red Line Extension (RLE) Project

Dear Mr. Rejman:

The Chicago Transit Authority (CTA) and Federal Transit Administration (FTA) are continuing efforts to prepare an Environmental Impact Statement (EIS) for the proposed Red Line Extension (RLE) Project in accordance with the National Environmental Policy Act (NEPA).The proposed project would extend the Red Line from the existing 95th Street Terminal to 130th Street, subject to the availability of funding.

CTA recently met with your agency on April 8, 2015 and presented information about the East and West options of the Union Pacific Railroad alignment, potential park impacts, and preliminary mitigation measures for each of the alignment options. In follow up to that meeting, this letter provides additional supporting information on the project, park impacts, and preliminary mitigation measures for further input from your agency. As the official with jurisdiction over these properties, CTA would like additional input from your agency on the following:

1. Confirmation on the attached documentation regarding primary activities and functions that take place at each of the three park properties that would be affected by the options under consideration, including which of these activities and functions constitute the primary purpose of these parks.

2. The views of your agency on the significance of each of these parks in terms of their existing availability and function in meeting the objectives of the Chicago Park District and the surrounding community as well as the impacts and/or benefits of the proposed project with mitigation measures implemented as proposed.

3. Comments and recommendations from your agency on the proposed mitigation measures for impacts and use of each park, including identification of any appropriate replacement park locations for the proposed project mitigation measures.

4. The views of your agency on whether, after implementation of these mitigation measures, the impacts presented would be adverse to the activities, features, or attributes of each park.

We also welcome any other feedback from your agency that would be useful in understanding the views, goals, and objectives of the Chicago Park District in relationship to the proposed RLE Project. Your input will be used and reflected in the Draft EIS and Section 4(f) Evaluation that is being prepared. Section 4(f) of the USDOT Act of 1966 protects significant historic resources as well as publicly owned recreation areas, parks, and wildlife refuges. Once your views on these matters are appropriately incorporated into the document, CTA and FTA will be providing documentation to your agency on the environmental impacts and Section 4(f) findings and will seek concurrence from the Chicago Park District on the determination made. Additional coordination meetings will be scheduled with your agency, as needed, to ensure proper coordination.

At this time, CTA expects to release the Draft EIS and Section 4(f) Evaluation for public review and comment in spring 2016. A public hearing will be scheduled at that time to take public comments on the environmental findings in the Draft EIS and Section 4(f) Evaluation. Based on the technical analysis conducted and public input received, a Final EIS/Record of Decision will be prepared. The Final EIS/Record of Decision will document the results of the Draft EIS process, confirm whether the East or West Option will be constructed, and include a list of committed final mitigation measures for the option chosen. CTA and FTA will continue to work with your agency through this process to keep you informed on the status of this project and to conduct follow up coordination activities, as needed. Additional information about the project is available at: transitchicago.com/RedEIS.

If you have any questions, please do not hesitate to contact me. Thank you for your participation on this project.

Sincerely,

Sonali

Michael Lange, Chicago Park District
Doreen O’Donnell, Chicago Park District
Reginald Arkell, Federal Transit Administration
Mark Assam, Federal Transit Administration

Project Overview and Description

The Chicago Transit Authority (CTA), as project sponsor to the Federal Transit Administration (FTA), proposes to construct the Red Line Extension (RLE) Project to extend the existing Red Line heavy rail transit service approximately 5 miles south from the existing 95th Street Terminal to 130th Street on Chicago's Far South Side. The project area for the RLE is approximately 11 miles south of the Loop (Chicago's central business district).

The National Environmental Policy Act of 1969 (NEPA) mandates the consideration of environmental impacts before approval of any federally funded project that may have significant impacts on the environment or where impacts have not yet been determined. FTA and CTA are currently preparing a Draft Environmental Impact Statement (EIS) for this project in accordance with NEPA and other applicable regulations, including Section 106 of the National Historic Preservation Act (NHPA), Section 4(f) of the United States Department of Transportation (USDOT) Act of 1966, joint guidance and regulations from FTA and the Federal Highway Administration (FHWA), and other agency regulations and guidelines.

After extensive planning and study, the Chicago Transit Board designated the Union Pacific Railroad (UPRR) Rail Alternative as the Locally Preferred Alternative (LPA) for this project on August 12, 2009. The UPRR Alternative route would run south along I-94 from the 95th Street Terminal, then curve west along the north side of I-57 (within the I-57 right-of-way) for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would turn south to follow the UPRR corridor.

Two options are being considered for the alignment along the UPRR corridor. The CTA elevated structure would be located either east or west of the existing UPRR corridor. The alignment would follow the UPRR corridor to Prairie Avenue, where it would cross over the Canadian National/Metra Electric District (CN/ME) tracks near 119th Street. South of this point, the East and West Options would follow the same alignment southeast along the NICTD/Chicago South Shore & South Bend Railroad (CSS & SBRR) right-of-way using a portion of the Indiana Harbor Belt Railroad (IHB) right-of-way to the terminus (end) of the RLE at 130th Street.

As described, two UPRR Alternative options for the segment of the proposed route between I-57 and the CN/ME tracks near 119th Street are under further evaluation:

- East Option - The CTA elevated structure would be placed immediately adjacent to the east side of the UPRR right-of-way.

- West Option - The CTA elevated structure would be placed immediately adjacent to the west side of the UPRR right-of-way.

An overview map of the project and alignment options is provided in **Figure 1**.

Park Impact Overview

All public parks within 500 feet of the proposed right-of-way and within ½ mile around the locations of proposed stations were analyzed for potential impacts as a result of implementing the project. **Table 1** summarizes park impacts as a result of each UPRR alignment option. **Figure 2** shows the locations of all parks in the vicinity of the project. The following section provides further details on the park or parks impacted by each alignment option.

Figure 2: Publicly Owned Park and Recreational Properties Adjacent to the Project

UPRR Alternative East Option - Park Impacts

Two park resources would be used as result of the East Option: Wendell Smith Park and Block Park, which are further described below.

Wendell Smith Park

Wendell Smith Park is approximately 4.7 acres (340 feet wide by 610 feet long) and is an actively used facility with basketball courts, baseball fields, a play lot, recreation building, and 0.3 mile of walking trails. Regularly scheduled activities at Wendell Smith Park include basketball tournaments, baseball/softball games, and concerts. The park is also actively used by day camps and for activities organized by the Chicago Park District.

The East Option alignment would run through the northwestern corner of the park, as shown in Error! Reference source not found.. Of the 4.7 acres of the park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. The overlap area includes open space, trees, benches, and a portion of the park's walking trail. The outfield of an existing baseball field would be used. Piers would be located in the park, and the bottom of the elevated structure would be approximately 15 feet above ground level. Because a permanent easement is proposed, the land within the easement would be considered a permanent incorporation (direct use) of the park facilities. Temporary closure of the overlapped portion of Wendell Smith Park would be necessary during construction.

Preliminary Mitigation Measures

Mitigation and enhancement measures are proposed that would result in no adverse effect to the features, attributes, and activities of the park after implementation, as follows:

- Replacement of impacted park space. Payment would be the fair market value of the land and improvements taken or improvements to the remaining site equal to the fair market value of the land and improvements taken. Location of replacement property would be further defined in coordination with the Chicago Park District.

- Relocation or replacement of the baseball field based on further coordination with the Chicago Park District and outreach to the public so that the attributes, features, and activities are not adversely affected by the use of the northwest corner of the park.

- Replacement of facilities affected by the project including sidewalks, paths, benches, lights, trees, and other facilities within the park.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

Figure 3: Impacts on Wendell Smith Park – -Union Pacific Railroad Alternative East Option

Block Park

Block Park is a passive green space and is divided into two parcels by Harvard Avenue. The east parcel is approximately 1.4 acres (130 feet wide by 460 feet long) and includes amenities such as benches, walking paths, and sidewalks. The west parcel is approximately 1.3 acres (90 feet wide by 600 feet long) and is open space with a sidewalk and no other park amenities. In addition, a radio tower and two utility structures are on the west parcel. Photos of Block Park are shown in **Figures 4** and **5**.

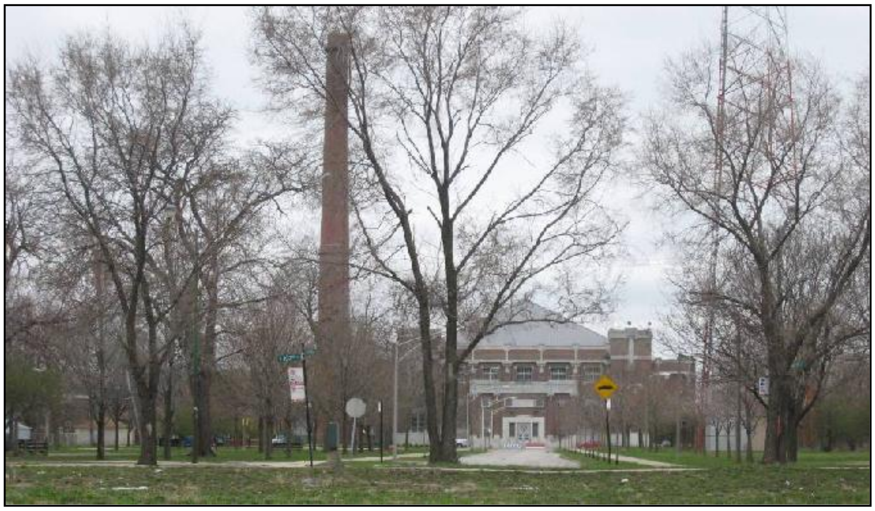

Figure 4: Block Park with the Roseland Pumping Station in the Background (facing south)

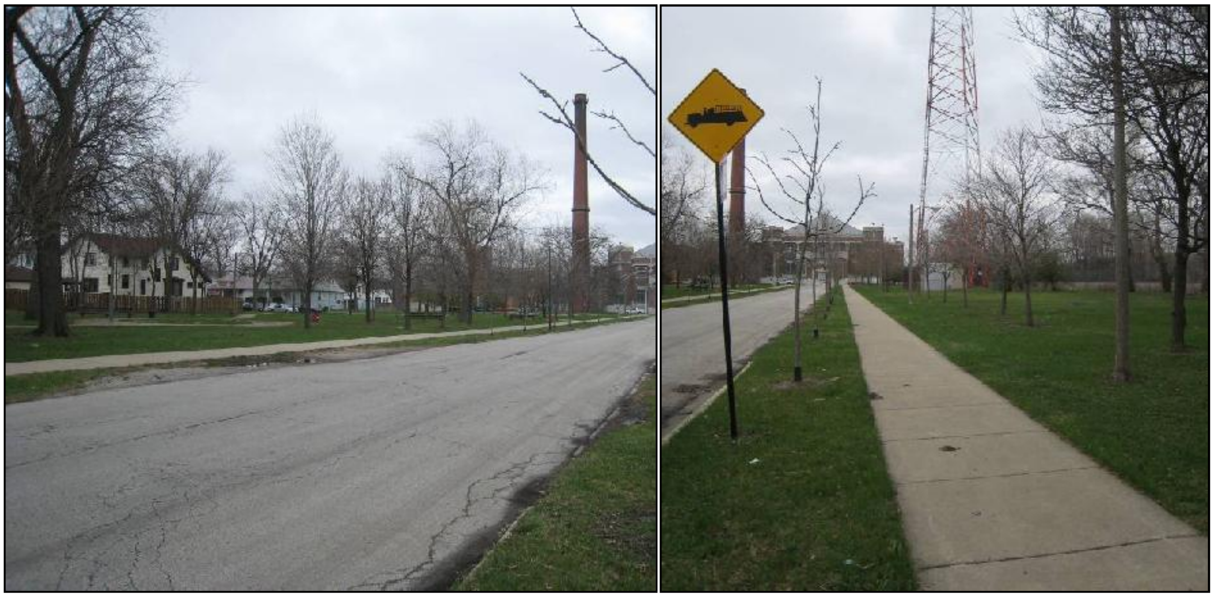

Figure 5: East Parcel (left) and West Parcel (right) of Block Park

The East Option alignment would run through the west parcel of Block Park, and would overlap 0.9 acre of park space with the elevated structure and its associated clearances, as shown in Error! Reference source not found.. A secondary station entrance would also be located in the park, along its western edge. The affected parcel includes an isolated portion of the park's open space and a communications tower, and does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the east parcel of the park. Because the East Option alignment elevated structure would overlap a portion of this park, there would be a permanent incorporation (direct use) of this passive greenspace. Some temporary closure of the overlapped area would be necessary during construction.

Preliminary Mitigation Measures

Mitigation and enhancement measures are proposed that would result in no adverse effect to the features, attributes, and activities of the park after implementation. CTA and the Chicago Park District are currently coordinating to define any additional or alternative mitigation measures that may be necessary:

- Replacement of impacted park space. Payment would be the fair market value of the land and improvements taken or improvements to the remaining site equal to the fair market value of the land and improvements taken. Location of replacement property would be further defined in coordination with the Chicago Park District. Providing enhanced park connectivity to the proposed station area at 103rd Street and other CPD park projects in the nearby area could be considered to enhance the attributes, features and activities of this existing passive green space.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the park but not adversely affect the safety of the transit facility.

Figure 6: Impacts on Block Park - East Option

UPRR Alternative West Option - Park Impacts

One park resource would be used as result of the West Option—Fernwood Parkway—which is further described below.

Fernwood Parkway

Fernwood Parkway is a passive green space, and is divided into two parcels separated by 101st Street. The northern parcel, from 99th Street to 101st Street, is approximately 2.4 acres (78 feet wide by 1,325 feet long). The southern parcel, from 101st Street to 103rd Street, is approximately 2.9 acres (78 feet wide by 1,277 feet long). Both the north and south parcels of Fernwood Parkway serve as open space and do not contain recreational facilities or amenities such as sidewalks or benches. Some trees are planted within the park and a chain-link fence separates the green space from the existing at-grade UPRR tracks. **Figures 7 and 8** shows Fernwood Parkway facing north and south.

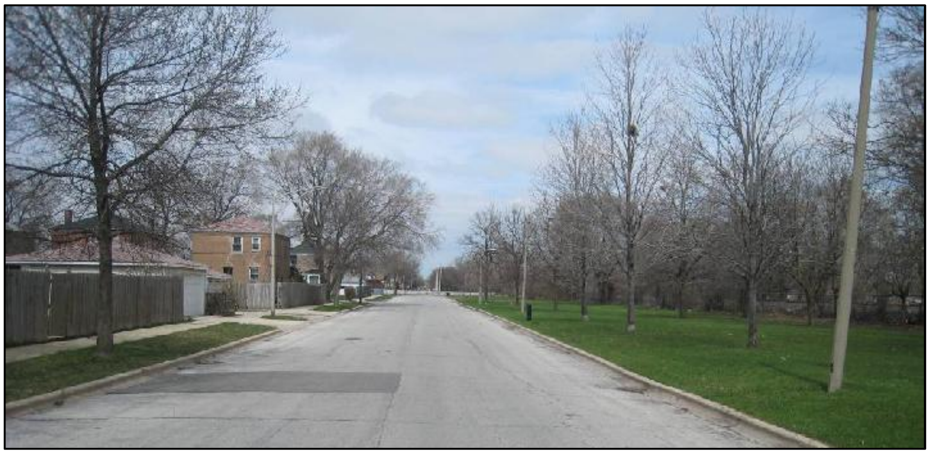

Figure 7: Fernwood Parkway at 100th Street and Eggleston Avenue (facing north)

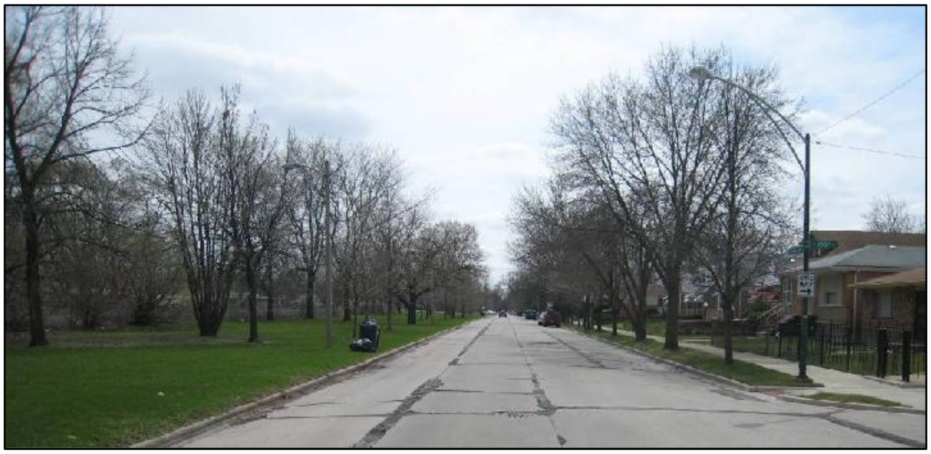

Figure 8: Fernwood Parkway at 100th Street and Eggleston Avenue (facing south)

The West Option track structure would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets. Approximately 1.9 acres of the parkway would be overlapped by the elevated structure and its associated clearances (see Error! Reference source not found.). The parkway functions as open space, and does not contain recreational amenities. Temporary closure of the section of the overlapped section of the parkway would be necessary during construction. Public use of the parkway could resume after construction, as long as the area beneath the elevated track structure is reopened, but much of the parkway between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Elevated track structure supports would be placed permanently in the park space. Because the West Option alignment elevated structure would overlap a portion of this park, there would be a permanent incorporation (direct use) of this passive green space.

Preliminary Mitigation Measures

Mitigation and enhancement measures are proposed that would result in no adverse effect to the features, attributes, and activities of the park after implementation, as follows:

- Replacement of impacted park space. Payment would be the fair market value of the land and improvements taken or improvements to the remaining site equal to the fair market value of the land and improvements taken. Location of replacement property would be further defined in coordination with the Chicago Park District.

- Potential installation of a new bicycle path beneath the elevated track structure, subject to use for CTA maintenance, which would enhance the existing unused green space and better connect parks and the newly proposed transit infrastructure.

- Restoration and landscaping of disturbed areas.

- Incorporation of design features where necessary to reduce or minimize impacts of use on the Section 4(f) property. Such features would be designed in a manner that would enhance the green space but not adversely affect the safety of the transit facility.

Re: CTA Red Line Extension (RLE) Project

Dear Ms. Tandon:

The Chicago Park District (CPD) appreciates the opportunity to review the draft of the proposed park impacts for the CTA Red Line Extension (RLE) Project dated June 8, 2015. Any proposed mitigation measures should include fully developed replacement property with the appropriate replacement improvements in the community area. The CPD's priorities for replacement park sites is to expand existing parks.

CPD's neighborhood parks range in size from 2-5 acres in size. These are parks that contain indoor and/or outdoor recreation facilities and typically include a playground and/or other sport fields. The standard for new parks is a minimum of two (2) acres in size. If Recognized Environmental Conditions are identified in the Phase 1 Environmental Site Assessment (ESA) then a Phase 2 ESA is required. If there are exceedances of the Illinois Environmental Protection Agency's (IEPA) TACO Tier 1 Residential Standards, then the property is required to receive a Comprehensive No Further Remediation (NFR) Letter from the IEPA's Site Remediation Program.

The documentation regarding primary activities and functions that occur in each of the three parks is accurate. CPD concurs conceptually with the proposed mitigation measures as outlined in the coordination package.

Wendell Smith (#272) Park is a 4.7-acre neighborhood park that primary serves the population within a ½ mile. Improvements include two basketball courts, two baseball fields, a playground, recreation building and .3 miles of walking trails. In addition to the areas described in the letter, the overlap area includes space behind the existing baseball backstop. Preliminary mitigation measures should include replacement property located in the Roseland Community area constructed in accordance with Chicago Park District standards.

Block (#1005) Park is a 2.95-acre passive park that provides informal active recreational uses or other accessory uses. The east option alignment affects the entire function of the 1.3 acre west parcel, including the accessory communication tower space. Preliminary mitigation measures should include replacement property located in the Roseland Community area constructed in accordance with Chicago Park District standards. Additionally, mitigation and replacement of the communications and utility structures is required.

Fernwood (#1215) Parkway is an 8.63-acre linear passive park that provides informal active recreational uses or other accessory uses. The parkway functions as open space and provides a quiet natural setting for park users. The Chicago Park District would not program or maintain areas beneath the elevated track structures. Preliminary mitigation measures should include replacement property located in the Washington Heights Community area constructed in accordance with Chicago Park District standards.

The suggested mitigations strategies coupled with the above comments should address all the adverse impacts on the Parks. We look forward to a successful collaboration.

Sincerely,

Rob Rejman
Director of Planning and Construction

RR/ml

Sonali Tandon	ST	CTA
Jenifer Palmer	JP	CWC Transit Group
Michael Lange	MH	CPD

PREPARED BY:	**Jenifer Palmer**
ISSUE DATE:	**October 19, 2015**

MEETING NOTES:

- Sonali Tandon (CTA) thanked CPD for their time and provided an update on the status of the Red Line Extension Project.

- CTA recently submitted the first draft of the Draft EIS document to FTA for their review. The reviews and updates to the document will continue through the fall and into early 2016. CTA and FTA expect to be ready to public the Draft EIS for public comment and hold public hearings in May 2016.

- CTA received CPD's response letter regarding potential park impacts and proposed mitigation measures that would result from implementation of either the RLE East or West alignment options. CTA updated the Draft Environmental Impact Statement (EIS) document prior to submitting to FTA to reflect this correspondence to date. Based on the feedback received from CPD, CTA is proposing *de minimis* findings for park impacts following implementation of mitigation measures since after these measures are taken into account, there would be no adverse impact to parks from either alignment option.

- CTA has also shared communications to date between CTA and CPD with FTA for their input. Based on coordination with FTA, they would like CTA to further develop replacement park/relocation of facilities mitigation measures. This will help to support the *de minimis* findings and will allow the public to provide more meaningful input on the proposed mitigation measures. To that end, CTA has prepared a scope of work for additional consultant services in further identifying replacement park options and relocation of impacted facilities. The draft scope of work was provided to CPD in advance of this meeting to gain their input.

- CTA and CPD staff reviewed the draft scope of work. In general, CPD agrees with the process outlined in the scope for identifying potential replacement park locations. ML noted that in addition to what is outlined, CPD typically conducts environmental screening (e.g. consulting sandborn maps, historic uses of sites, etc) in the form of a Phase 1 ESA when identifying any new feasible park location.

- CTA noted that a number of environmental screenings have been done within the corridor to date and could be used, as appropriate, for this analysis. More specific site information would need to be gathered. CTA will review the potential for a Phase 1 ESA of sites as well as costs associated with that additional scope. It could be that the same information provided in a Phase 1 ESA are available through existing analysis and data or combination of reviewing data described within the scope of work. If not practical at this juncture of the project, commitments could be outlined in further developing the mitigation measures on requirements like a Phase 1 ESA following public input in May 2016 and in developing the Final EIS documentation.

- Because implementation timelines for obtaining new park sites will ultimately be based on the timeline for the Draft and Final EIS and securing federal, state and local funding for the project, CTA is most concerned with laying out some potential options for replacement parks and more specifically, identifying the process and commitments for doing this. While consultant staff may be able to identify suitable replacement park and amenity locations in this phase, those properties may or may not be available when replacement actually occurs. As such, it is equally important to both identify potential replacement parks and outline the requirements for carrying out mitigation measures.

- CPD also mentioned that they have some guidelines/standards for new park development that could be shared with consultant staff to support development of viable replacement options. As a matter of policy, CPD is focused on developing safe parks that are well connected to the transportation network. CPD also attempts to develop parks that are at least 2 acres in size. In addition, parks that are city-owned properties already may allow for more efficient implementation options since they would need to consider similar environmental impacts to any lands that they own. CPD is most interested in replacement options that could expand connectivity and park facilities over smaller pocket parks in the neighborhood but which lack this same level of connectivity.

- CPD provided early analysis done for potential replacement parcels so that the consultant team can consider this in their analysis. CPD only conducted very preliminary investigations into this area to date. CTA and CPD staff reviewed each potentially impacted park to identify any guidelines or general considerations that might apply to looking at replacement options and relocation of facilities impacted. CPD expects acre for acre replacement park land and facilities impacted.

- CTA noted that once the scope of work is finalized, consultant staff will be beginning field visits and initial investigations. In scheduling field visits, CTA asked whether there are an park supervisors or area managers that the team might be able to coordinate with and CPD noted that area managers might be best since they are in charge of larger areas/multiple parks and may have some larger insights on existing uses and community park needs. CPD will provide available contact information so that this coordination can occur.

- CTA asked whether there are any park advisory councils in the area that the team should be coordinating with in understanding issues or obtaining more input on community needs. CPD will check to see if there is a park advisory council in this area.

- CTA thanked CPD again for their time. As the consultant team begins their investigations, the expectation is that we will be setting up regular coordination meetings through Spring 2016 to share developments and results in this process and obtain additional input and recommendations from CPD staff. There may not be a need to meet next month, but once this study actually begins, it may make sense to have monthly coordination. With holidays and the schedule for completing Draft EIS documentation prior to publishing, we would hope to complete coordination activities for further developing these measures through March 2016. Additional coordination would occur to share public input once the Draft EIS is published as well to determine appropriate next steps.

MEETING NOTES

RE: **Chicago Park District Coordination Meeting**
Chicago Transit Authority Red Line Extension Project

DATE: **March 10, 2016, 10:00 a.m.**

LOCATION: **Chicago Park District, 541 N. Fairbanks Court, Chicago, IL**

ATTENDEES:

Name	***Initials***	***Organization***

Sonali Tandon	ST	CTA
Michael Lange	ML	CPD
Jenifer Palmer	JP	CWC Transit Group
Dave Sousa	DS	CWC Transit Group
Cody McChane	CM	CWC Transit Group

PREPARED BY: **Cody McChane**

ISSUE DATE: **March 15, 2016**

MEETING NOTES:

- Michael Lange suggested that due to an ongoing conflict, monthly coordination meetings should be rescheduled from Thursday to Wednesday mornings.

- Sonali Tandon (CTA) thanked CPD for their time, provided a recap of the work that has been done since the previous CPD Coordination Meeting on October 19, 2015, and discussed the purpose of the meeting.

- Jenifer Palmer (CWC) provided an overview of the Red Line Extension (RLE) Project and reviewed the potential park replacement site identification process undertaken by CWC and CTA. Preliminary analysis focused on identifying sites that would replace affected parkland (1.6 or 1.9 acres depending on the alignment option) and meeting CPD guidelines for new park acreage (2 to 5 acres). Considerations for the East Option also included locating sites within the Roseland community area and replacement of an affected ballfield. Considerations for the West Option also included locating sites within the Washington Heights community area. The initial investigation yielded 22 potential sites, 10 of which were eliminated from consideration following field investigation due to insufficient acreage, environmental concerns, non-contiguous available parcels or required crossing or reconfiguration of major roadways, or active uses currently onsite.

- CWC found no viable replacement sites within the Washington Heights community area that met all required criteria. The team discussed that due to the lack of viable options and the physical barrier of I-57 between Fernwood Parkway and northern Washington Heights, it may be difficult to find a replacement site in Washington Heights. CTA asked if it would be acceptable to locate a replacement site in another adjacent community area. ML agreed that a replacement site could be located in another adjacent community area. CWC requested that this allowance be made in writing for the federal environmental documentation with the Federal Transit Administration.

- JP reviewed the 12 park replacement sites considered potentially viable after field investigation. The replacement park sites fell into three categories: (1) sites adjacent to the RLE alignment, where a park could enhance a proposed station location and its potential for redevelopment; (2) under-utilized commercial areas with large amounts of vacancy and pending redevelopment; and (3) vacant sites with connection to existing parks such as Gano Park and/or the Major Taylor Trail.

- CWC identified nine sites as potential replacement park sites for either the East or West Options. The remaining three sites identified would only be viable for the East Option due to their location along the west side of the current UP right-of-way (ROW). Benefits and drawbacks of each site were discussed.

- Multiple potential sites are located on or near commercial corridors, and a park may not be the highest and best use in terms of zoning in these locations. CPD typically consults with Chicago Department of Planning and Development (DPD) to determine criteria for best use in these situations. The team discussed that in an area with disinvestment, parks can help spur development. CDM Smith has experience with park master plans, assessing supply and demand of parkland and amenities, and using parks as catalysts for these types of reinvestment.

- CPD’s first priority is to locate replacement parks within 0.5-mile of affected parkland. However if this is not possible, ideal locations would fill an existing gap where there is not currently a park within a 0.5-mile walkshed. Site 2B was referenced as one site that may fill such a gap. Sites distant from the anticipated impact but close to an existing park, such as sites 9A and 9B, do not fill as great a need and therefore are less preferred.

  Multiple potential sites would be adjacent to proposed CTA stations and on parcels that are currently under consideration by CTA for park & rides. CWC has performed only a high-level analysis to date, and additional analysis will be done as the RLE project moves into future stages of planning.

- Sites 6, 7, and 8 are located between the UP ROW and an alley, with the rear of houses facing the sites. Parks in these locations may present security concerns as they would not be very visible from major streets.

- Soil suitability is likely to be an issue for all sites. There is particular concern for the ability of soil at Site 10 to sustain healthy grass and trees. Due to the urban environment, soil remediation may be necessary at all sites before constructing a park.

- In the past, CTA discussed with DPD that the property on which Site 11 is located is proposed to be developed with an Aldi grocery store; however, development hasn't occurred and the project status is unsure. If Site 11 moves forward into the next stage of consideration, coordination with DPD would be necessary. Sites 11 and 12 are positioned for redevelopment because they are close to a proposed CTA station and the existing Metra station, and they are close to the Michigan Avenue commercial corridor.

- ML suggested consulting with Kathy Dickhut of DPD, who manages sustainability and has expertise in the preservation of industrial uses, for sites near manufacturing/industrial uses such as Site 15. There is a priority within the City to not displace limited remaining industrial property.

- ML reported that CPD is currently evaluating both Sites 10 and 17 for possible acquisition and conversion to new parkland because they are adjacent to the Major Taylor Trail. CPD may be able to share additional information on these sites. However, if CPD moves forward, these sites would likely not qualify for park replacement purposes.

- JP presented proposed criteria for the next phase of site analysis, which will include (1) proximity to area of impact, (2) environmental site analysis (EDR reports), (3) ownership availability, (4) surrounding land us/zoning compatibility, (5) accessibility, and (6) generalized cost of acquisition and construction. ML, ST, and JP concurred on the proposed criteria. JP reiterated that there will be no Phase I ESA completed for potential sites at this time, due to uncertainty of alignment and other compounding factors. CWC will complete an environmental screening similar in content to a Phase I ESA in the interim. JP noted that the outcome of this investigation is to keep multiple park replacement site options for each RLE Option. This will allow for presentation and further input between CPD, CTA, DPD, community stakeholders, and members of the public.

- Criteria for a replacement ballfield were discussed. CWC reported measuring the potentially affected ballfield (which would be affected by the East Option only) at roughly 130 feet in diameter, suitable as a "tot lot" or for tee-ball. DS reported that published standards only address little league fields which are larger than the affected field. ML reported that replacement in kind may be appropriate for CPD and he will discuss with his colleagues. CWC requested clarification of mitigation requirements in writing for purposes of the federal environmental documentation.

- CPD's decision process was discussed. Heather Gleason is the new director. ML will need to update her on this project. Once the sites are narrowed down, they will take it to their General Superintendent and CEO and to get his buy-in. CPD only needs to take it to their Board if they are planning to dispose land or acquire or accept land. They have to show the disposition and the acquisition simultaneously. CWC noted that the acquisition of land and further definition of site replacement would not occur at this phase of the environmental planning process. Once an alignment option is chosen at the end of the Draft Environmental Impact Statement (EIS) phase, a Final EIS will be prepared and CTA would perform additional detailed analysis of chosen sites.

As such, no Board approvals or acquisitions are anticipated until the end of environmental planning phases.

- CTA will hold a public hearing for the Draft EIS (tentatively scheduled for October). CPD is willing to help coordinate and provide space, likely in Palmer Park. There could be benefit to work with people in the community (small stakeholder group and aldermen) in the summer before the public hearing to discuss the park mitigation process and to gather community input. CPD would be willing to participate in the meeting. There are no park advisory councils in these neighborhoods, but CPD Area Managers are active with community leaders and have a finger on the pulse of the community and park needs. Area Managers can be useful for coordination as well, and CPD will invite the Area Manager for the study area to the next coordination meeting. Individual park supervisors might also contribute to the discussion because they know the individuals and families that use parks.

- Leah Dawson Mooney (CTA) suggested site visit to show potential sites to CPD, which could help with the decision-making process.

Action Items

- CTA will update monthly coordination meetings to Wednesday as per CPD request.

- CPD will review the potential sites discussed in this meeting and will provide feedback within one week on:
    1. Initial site options discussed today and any sites that may be further eliminated from secondary suitability analysis screening
    2. Ability to modify mitigation options for the West Option to adjacent community areas outside of Washington Heights
    3. Ballfield replacement size criteria
    4. Proposed suitability criteria

- CPD will reach out to the local Area Manager for parks in the replacement park area and invite that contact to attend the next monthly coordination meeting in April.

- CWC will initiate the analysis of suitability criteria discussed, and report findings of most suitable replacement site options during the next monthly meeting.

- CWC will provide any modifications to mitigation proposed in the Draft EIS based on CPD input above in writing for CPD concurrence for federal environmental documentation purposes.

MEETING NOTES

RE: **Chicago Park District Coordination Meeting**
Chicago Transit Authority Red Line Extension Project

DATE: **April 6, 2016, 10:00 a.m.**

LOCATION: **Chicago Park District, 541 N. Fairbanks Court, Chicago, IL**

ATTENDEES:

Name	*Initials*	*Organization*
Leah Dawson Mooney	LM	CTA
Sonali Tandon	ST	CTA
Doreen O'Donnell	DO	CPD
Michael Lange	ML	CPD
Jenifer Palmer	JP	CWC Transit Group
Cody McChane	CM	CWC Transit Group

PREPARED BY: **Cody McChane**

ISSUE DATE: **April 14, 2016**

MEETING NOTES:

- Jenifer Palmer (CWC) provided an overview of the Red Line Extension (RLE) Project and reviewed the potential park replacement site identification process undertaken by CWC and CTA. Preliminary analysis focused on identifying sites that would replace affected parkland (1.6 or 1.9 acres depending on the alignment option) and meeting CPD guidelines for new park acreage (2 to 5 acres). The initial investigation yielded 22 potential sites, 10 of which were eliminated from consideration following field investigation due to insufficient acreage, environmental concerns, non-contiguous available parcels or required crossing or reconfiguration of major roadways, or active uses currently onsite.

- After the last meeting with CPD, CWC and CTA completed a Suitability Analysis for the remaining 12 sites that included six criteria: (1) proximity to area of impact, (2) ownership/availability, (3) surrounding land use/zoning compatibility, (4) safety and security, (5) high level cost considerations, and (6) environmental factors (EDR reports). Each site was given a score of low, medium, or high for each of these unweighted factors. CWC and CTA presented the six sites with the highest scores to CPD. Two additional sites were also reviewed as close scoring contenders or where additional inputs were needed for scoring purposes and further refinement of viable replacement park options.

- Leah Dawson Mooney (CTA) asked CPD for feedback on the Sustainability Analysis process and criteria. Michael Lange (CPD) suggested assigning increased weight to site locations. Doreen O'Donnell (CPD) stated that locating a park in a community area of need is a high priority for CPD, and locations that are not very close to the affected parks can be assigned a high score for location if they help to fill an existing park access gap, defined as the lack of park space within a ½-mile walk shed. Within the study area, West Pullman and Roseland have some identified park needs, while Morgan Park is not identified as a community in need of additional park space.

- CWC also assigned higher scores to potential sites that are proximate to existing parkland such as the Major Taylor Trail, or that connect well with bicycle facilities and transit, including proximity to planned Red Line stations. CTA has not typically looked at park integration near major transit stations in other projects such as the Brown Line on the north side of Chicago. However, the addition of parks and other open space has been shown to spur economic development in underdeveloped areas and may be appropriate in the context of this project area.

- Sonali Tandon (CTA) clarified that project design and construction has not yet been funded. The identification of potential park replacement sites is an iterative process that can evolve to suit the needs of CPD as it moves forward. Because the RLE project timeline is long-term and environmental factors and site availability may change by the time the project receives funding, this study will provide a toolbox for use when the project moves into the land acquisition phase. The study outlines a decision-making process that will clarify to the Federal Transit Authority and stakeholders how park replacement sites are identified and indicate availability of replacement park sites.

- JP presented the six sites identified that earned the highest scores in the Suitability Analysis, in order from the highest to the lowest score.

    - Site 8A is a large parcel of land that would allow for the activation of varying uses due to its size and shape, and is adjacent to a community center and a family services center. The site would be a viable option for both the east and west rail alignments under consideration, which would help increase flexibility and streamline the public input process. Its location would also fill a park access need.

    - Site 3B also would allow for multiple uses, and would complement existing Block Park on the opposite side of the proposed rail alignment. This would be an option for the east alignment only.

    - Both sites 8A and 3B are adjacent to proposed CTA stations. Their strong connection to transit helped them score highly in the Suitability Analysis, but portions of both parcels have been identified as potential park and ride sites. The 103rd St. and 111th St. stations are intermediate stations and would only need to provide parking for the community, whereas the terminal station on the line must provide parking for larger populations. Both sites are adjacent to other parcels that have been identified as potential alternative park and ride locations. At the proposed 103rd station (Site 3B), there is a potential for further utilizing a potential park and ride location on the east side of the tracks as an alternative to this site. At the proposed 111th station (Site 8A), no additional park and ride locations are currently identified and modification of proposed park and ride plans at that location would need further CTA consideration.

  - Site 7 would offer the ability to create bicycle and pedestrian connections due to its linear orientation, and is near Roseland Christian School but across the proposed alignment. The site abuts an alley and the rear of residential properties, and earned a lower score for safety and security. A cell phone tower is located on the site. CPD clarified that they require that transferred land must be "free and clear" of all structures.

  - Site 12 is adjacent to a proposed transit station and includes buildings that will be demolished by the city. A portion of this site is also currently identified for a proposed park and ride as part of the RLE Project and CTA would need to reconsider plans at this location if further considered for park replacement. The site is adjacent to Site 11, which is currently slated for a planned development by the city.

  - CTA will coordinate with the Chicago Department of Planning and Development (DPD) on all potential sites, including monitoring the status of Site 11.

  - Site 6 includes a large amount of acreage but would be an option for the east alignment only. Like site 7, it abuts an alley and the rear of residential parcels and safety and security would be an issue to be addressed. Two buildings on the south end were identified as vacant by the Property Appraiser but would need to be checked using a title search. The use of these properties would allow access to 107th and improve connectivity and safety and security.

  - Site 10 is a very large area that is adjacent to the Major Taylor Trail. It is located in Morgan Park, which has not been identified by CPD as a community in need of park space. CPD is also in the process of acquiring additional land in that community area, and adding another large park may be politically difficult. Site 10 was eliminated from consideration.

- Two additional sites did not score as highly but are still under consideration. Site 2B may require the acquisition of one or two currently active residential parcels. However it would be served well by the CTA bus system and would help to fill a park access gap identified by CPD. Site 11 may be under consideration pending DPD's update on the potential for a planned development. Both Sites 11 and 12 require further discussion with DPD on anticipated plans at those locations on coordination of park replacement as well as proposed park and ride plans.

- JP provided an overview of the next steps required. About six sites are still under consideration, we want to narrow that down to three final options to present at public meetings. CWC and CTA will create concept plans and cost estimates upon confirmation of these three options.

- Future analysis of sites will include consideration of wards, and Aldermanic support is crucial to land acquisition and park creation.

- CPD is in the process of creating new parks or small open spaces in both Roseland and West Pullman. CPD will overlay the remaining potential replacement sites on their parks access map and report their findings. CWC and CTA will change the location/proximity score accordingly.

- CWC and CTA will draft revised mitigation measures language to include changes to proximity requirements and identification of access gaps and communities of need, and the in kind replacement of the junior ball field in Wendell Smith Park, and send to CPD for concurrence.

- The next step is to coordinate with DPD, and they will be invited to the next monthly meeting on May 11, 2016. Erika Sellke, Kathy Dickhut, and Nelson Chueng were identified as staff members that should be involved from DPD.

Action Items:

- CTA to coordinate meeting between CPD, DPD, and project team for next monthly coordination meeting.

- CPD will overlay the remaining potential replacement sites on their parks access map and report their findings. CWC and CTA will change the location/proximity score accordingly and also evaluate higher weight for this criterion.

- CTA to provide updated mitigation measures correspondence to CPD for confirmation/concurrence.

MEETING NOTES

RE: **Chicago Park District and Department of Planning and Development Coordination Meeting**
Chicago Transit Authority Red Line Extension Project

DATE: **May 18, 2016, 2:30 p.m.**

LOCATION: **Chicago Park District, 541 N. Fairbanks Court, Chicago, IL**

ATTENDEES:

Meg Gustafson	MG	DPD
Erika Sellke	ES	DPD
Jenifer Palmer (call-in)	JP	CWC Transit Group
Cody McChane	CM	CWC Transit Group

PREPARED BY: **Cody McChane**

ISSUE DATE: **June 1, 2016**

MEETING NOTES:

- Sonali Tandon (CTA) provided an overview of the Red Line Extension (RLE) Project and reviewed the potential park replacement site identification process undertaken by CWC and CTA. Preliminary analysis focused on identifying sites that would replace affected parkland (1.6 or 1.9 acres depending on the alignment option) and meeting CPD guidelines for new park acreage (2 to 5 acres). The initial investigation yielded 22 potential sites, 10 of which were eliminated from consideration following field investigation due to insufficient acreage, environmental concerns, non-contiguous available parcels or required crossing or reconfiguration of major roadways, or active uses currently onsite. Eight sites currently remain under consideration following a suitability analysis that scored sites based on location, availability, land use/zoning compatibility, safety and security, environmental factors, and cost considerations. Three final sites are to be selected for further development and presentation to the public.

- CPD prefers sites that are within one mile of the proposed transit corridor, are not within one half mile of an existing park, and help fill a half-mile park access gap. CPD provided maps depicting “Final Focus Areas” that are not within one half mile of a park. Sites 2B and 8A meet these three criteria.

- Meg Gustafson (DPD) confirmed that the city-owned parcel data that has been used by CTA and CWC is the most current data available. At this time, CTA is not requesting to prevent development on city-owned parcels under consideration for use as replacement parkland due to project uncertainty.

- Attendees reviewed the final eight sites under consideration.

    - Site 2B – A Chicago Housing Authority project, likely senior housing, may be located nearby. This is a preferred site for CPD due to its proximity to the proposed corridor and affected parks, and ability to expand half-mile access. It is also a viable site for both the east and west options.

    - Site 3B – A park and ride lot has been proposed at this site, but its precise location and size can be readdressed. This site is viable for the east option only. CPD prefers this site as an alternate under the east option as it would be an expansion of Fernwood Parkway.

    - Site 6 – This site is only viable under the east option, and is very close to Fernwood Park.

    - Site 7 – This site contains a cell/communications tower. Removal would likely require contracting a private company. City rules and process for tower removal will need to be documented regardless of park site selection due to the tower located in Block Park.

    - Site 8A – This is a preferred site for CPD because it is very close to one of the Final Focus Areas for half-mile access, and is viable for both the east and west options. A park and ride lot has also been proposed at this site, but its precise location and size can be readdressed.

    - Site 10 – This site is removed from consideration, because Morgan Park is not a community of need and the site does not meet CPD’s three criteria above.

    - Site 11 – This site is a Planned Development, but is not currently owned by the city. It was originally reserved for an Aldi grocery store but this hasn’t happened yet. The community would prefer a grocery store in that location. The Planned Development designation likely has a sunset clause of ten years, DPD will check and report back. Because this site is very large, it may be feasible to incorporate park and ride and transit-oriented development in one site. The park could serve the Elementary school next to the site and may also help incentivize development of the rest of the parcel; however developers usually prefer frontage on major streets (State St., Michigan Ave., and 115th St.), and rear of the site maybe left for park space, which is not ideal.

    - Site 12 – One or two parcels are currently city-owned, and the structures fronting Michigan Avenue are slated for demolition. CPD favors site 12 over site 11 because they would prefer their own site as opposed to coordinating space with a park and ride lot and transit-oriented development. This site would be next to the proposed Michigan station and could serve as a “gateway” to the Pullman Community Area.

- Attendees discussed the value of creating parks on commercial corridors and whether it constitutes highest and best use. Within the context of the study area, park space can help incentivize much needed economic development. DPD stated that they are okay with parks in the sites as discussed.

- Attendees agreed that the final sites moving forward will be 2B, 8A, and either 11 or 12, pending DPD feedback. Site 3B will be an alternate for the East Option.

- Aldermanic feedback will be solicited once the final three sites are confirmed.

- Regarding disposition of land from CPD to CTA, the Transfer Act will need to be consulted. CPD may be able to dispose land directly to CTA, or may need to go through the city. Block Park is owned by the Department of Water Management and leased to CPD. This could pose issues with acquisition in the event that the east option is chosen.

MEETING NOTES

RE: **Chicago Park District Coordination Meeting**
Chicago Transit Authority Red Line Extension Project

DATE: **June 15, 2016, 10:00 a.m.**

LOCATION: **Chicago Park District, 541 N. Fairbanks Court, Chicago, IL**

ATTENDEES:

Name	***Initials***	***Organization***
Sonali Tandon	ST	CTA
Doreen O'Donnell	DO	CPD
Michael Lange	ML	CPD
Jenifer Palmer (call-in)	JP	CWC Transit Group
Dave Sousa	DS	CWC Transit Group
Cody McChane	CM	CWC Transit Group

PREPARED BY: **Cody McChane**

ISSUE DATE: **August 3, 2016**

MEETING NOTES:

- Dave Sousa (CWC) provided an overview of the site selection process and the meeting agenda.

- CWC presented site plan sketches for Wendell Smith Park and the three potential replacement park sites. Multiple options for each site were presented because the East Option and West Option influence site dimensions and requirements differently and because there are currently active uses at some sites.

- CPD mentioned that the information on their website could be inaccurate, and that there are two intact and actively used ballfields at Wendell Smith Park. There is currently no t-ball programming at the southwest field. The main use for that smaller ballfield is informal kickball.

- Under the East Option, reconstruction of pathways, trees, and likely both ballfields will be necessary because construction staging will need to take place in Wendell Smith Park.

- The ballfields that currently exist in Wendell Smith Park do not comply with Little League standards, and two such fields would not fit in the park. CPD agreed that replacement fields only need to comply with Pony League regulations, and two such fields would fit in the park under the East Option as shown. The fields should have outfield fences to prevent players from running onto the adjacent field or backing into a pier supporting the elevated rail structure that would be nearby.

- CTA will own the land within 15 feet of the eastern edge of the alignment, and park amenities such as the walkway and path should not be placed west of that line. CPD recommended that CTA consider placing a fence at the property line. Such a fence would likely create a conflict point with one of the Pony League fields, and if so two fields would not fit in the park.

- CPD suggested building one larger high school-sized field on the site rather than both fields to provide the greatest level of improvement to the field amenity. In this case, the field should be reoriented so that home plate is in the southwest corner for best sun lighting.

- Site 2B, at 101st Street and Michigan Avenue, would be viable under both the West and East Options. A ballfield replacement would be possible only with voluntary acquisition of an active use residential parcel. A replacement park without a ballfield and without acquisition of this parcel would still be 2 acres.

- A fence is not required around a replacement ballfield at this site, though CPD usually puts a fence around parks to help define boundaries and discourage fly dumping. Fences do not need to be depicted in future sketches.

- Gateway features as shown in the site plan sketch for site 2B, Version 2 should be excluded at this point. Future sketches will depict the site without gateway features.

- Site 2B, Version 1, currently shows acquisition of the active use residential parcel. This should be shown in Version 2, with Version 1 showing the parcel remaining with the current owner. Property owners cannot be displaced for the construction of park amenities, and all public materials must be clear that Version 2 is dependent on voluntary acquisition only.

- The site plan for site 8A under the East Option depicts both a replacement park and park and ride lot. Current plans call for 145 parking spaces total at the site (200 total near the station) but that could be refined in later stages, possibly leaving more space for a park. The current site plan shows 2.0 acres of park space.

- The site plan for site 8A shows a new parking lot for the youth center near the site, because Eggleston Avenue, which the youth center currently uses for parking, would be made into a bus driveway. CTA/CWC will coordinate with DPD regarding whether a parking designation has been made for the youth center that makes parking on Eggleston an official use.

- A park at site 8A would require voluntary acquisition of a commercial parcel that may not be vacant. This is to be made clear on all public materials. The property owner will be included in displacements outreach for the West Option, however under the East Option the property would not be displaced.

- The site plan for 8A under the West Option shows that there is not enough space available for a 2-acre park in addition to the park and ride lot called for in current plans. Projected parking needs may be reduced in future steps, which could clear 2 acres for a park, but that discussion will be tabled until the Final EIS is prepared.

- The sketch for site 12 under the West Option depicts a 2.4-acre park with a Pony League size field. Under the East Option, the field is reduced to a t-ball field, generally recommended for children under 6 years old.

- The sketch for site 12 under the East Option shows an emergency access road parallel to the proposed rail station. CTA will check if this can be a dual-purpose sidewalk path and access road so that it can be integrated with park space and located on CPD property to avoid duplication of walkways.

- In Version 2 of site 12 under the East Option, with the rail station relocated to the west side of Michigan Avenue, an expanded park is shown to account for the narrowing of track right of way without the station being adjacent to the park. The site plan should instead mirror Version 1 for public presentation to facilitate visual understanding.

- CPD confirmed that parking will not be required at a replacement park.

- CPD generally constructs ballfields with clay infields instead of grass to reduce maintenance needs and costs. CWC will depict ballfields at all sites with clay infields and backstops, and without dugouts, in future sketches.

- Basketball courts could be polarizing and should not be shown in the concepts. CPD will not be constructing amenities in the replacement park. Because impacted amenities must be replaced in kind, CTA will be required only to provide passive recreation space (grass), trees, and walking paths in addition to a ballfield, if needed. Future sketches of all potential replacement sites will depict passive recreation space and street and shade trees instead of basketball and tennis courts, playgrounds, and other active use amenities other than replacement ballfields. CTA suggested that when presenting these concepts to public, it would be good to get feedback on what additional features would people like to see in these parks.

- CPD noted that it would also be useful to show impacts to Fernwood Parkway and Block Park for public consumption and understanding.

- CWC will update all site plans and provide to CPD. Another in-person meeting is likely not necessary.

Considerations within Washington Heights Community Area (West Option – Fernwood Parkway Mitigation)

Washington Heights Community Area

Replacement park within Washington Heights community area was noted for mitigation of the West Option (Fernwood Parkway)

While Fernwood Parkway is located within the Washington Heights community area, field reviews and GIS analysis indicated that there are no suitable replacement park locations in this area

Washington Heights is separated by the interstate, which divides this neighborhood

Fernwood Parkway is more closely identifiable with Roseland community area due to transportation facilities and land uses

Two areas were initially identified, but removed from further consideration due to:

- Acreage insufficiency
- Non contiguous parcels needed for park acreage replacement, and would require additional roadway reconfigurations
- Some linear space was identified for bike/ped connection, but would not provide for park acreage replacement

Field Notes/ Considerations

- Potential location for a pedestrian and bicycle path
- May provide connection to existing Vincennes Ave. bike lane
- Does not provide replacement park acreage capability

Site 3A

Roseland Community

Ward 9

0.76 Acres

Field Notes/ Considerations

Eliminated from further screening due to:

- Acreage not sufficient on its own for either alignment option and was reviewed for combination with Site 3B
- Under consideration for Park and Ride location along with a portion of Site 3B; will need to reconsider needs if used as park
- Would still divide Block Park, but might be able to create a ped bridge or crossing to make area more cohesive
- Located near station and on a commercial corridor (103rd St.); park may not be best use.

Attachment 4: Suitability Analysis Assessment Notes

The following are notes on the 12 sites that were screened for suitability as replacement park locations for the Red Line Extension park impacts. A qualitative assessment of six factors was conducted and for each factor, a high, medium, or low suitability score was assigned. High, medium and low scores were then translated into numerical scores as follows:

- High = 5
- Medium = 3
- Low = 1

Total scores were developed for each replacement options by adding up all factors equally. One additional weighting factor was included based on subsequent coordination with CPD – additional points were provided to sites fulfilling a gap in existing parkland within surrounding community areas where park impacts are proposed to occur. Negative points were associated with properties that are not near the park area and slated for park improvements as part of other CPD projects.

A summary of the ratings for all properties is provided below and additional details are provided on ranking considerations for each property reviewed.

Criteria	2B	3B	6	7	8A	9A	9B	10	11	12	15	17
Location/Proximity	5	5	5	5	5	1	1	3	1	3	1	1

Environmental Factors (EDR)	3	3	3	3	3	3	3	5	3	3	1	3
Cost Considerations	3	5	3	5	5	1	3	5	3	5	3	5
TOTAL SCORING:	**25**	**22**	**20**	**21**	**29**	**10**	**12**	**23**	**16**	**26**	**16**	**16**

Site 2B – Total Score = 25

Location/Proximity: Score 5

- Within one mile of impacted parks for both East and West Options and would serve similar community
- Is in an area where there are less available parks in the immediate area for residents
- Per CPD coordination, additional weighting given to site as it would help to fulfill a current identified gap in parks

Vacancy/Availability: Score 3

- Meets acreage requirements of mitigation measures and new park standards.
- Majority of land is currently vacant with a minimal number of property owners (3 private property owners and one City of Chicago property)
- Would require acquisition of at least 1 active, privately owned residential properties to provide a baseball field replacement

Land Use/Zoning Compatibility: Score 5

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1) is compatible with park uses
- Location is along Michigan Avenue, a corridor that is currently disinvested; park uses would be compatible with current land use and zoning and enhance community character area

Safety/Security: Score 5

- Highly visible site location along arterial commercial corridor
- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 3

- Low to medium costs, and may require demolition of one building if acquiring/demolishing active use residential parcel

Site 3B – Total Score = 22

Location/Proximity: Score 5

- Directly adjacent to proposed station at 103rd Street
- Size and shape of parcel is ideal for multi-uses within park setting
- Within .5 miles from either East or West alignment option impacts

Vacancy/Availability: Score 1

- City owned property and vacancy available
- Would compromise existing planned park and ride as part of the RLE Project

Land Use/Zoning Compatibility: Score 3

- Current zoning – Residential (RS-2) and surrounding zoning residential (RS-2), park (POS-2), and commercial (C1-1 and C2-1); generally compatible uses for a park
- Directly adjacent to Block Park to the west of the proposed alignment; park space already exists and may not be the best use for this site location given other nearby park availability

Safety/Security: Score 5

- Highly visible site location along arterial active corridor and adjacent to proposed station
- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 5

- Low/Medium cost and would require demolition of one existing building

Site 6 - Total Score = 20

Location/Proximity: Score 5

- Adjacent to proposed station/alignment with potential for connecting access
- Within .5 miles from either East or West alignment option impacts

Vacancy/Availability: Score 5

- All parcels shown as available/vacant in Property Appraiser database
- Several parcels comprising the site are city owned, and there are a limited number (3) other property owners to obtain property; for sale sign noted on field investigation

Land Use/Zoning Compatibility: Score 3

- Current zoning – Limited manufacturing/business park(M1-1) and surrounding zoning residential (RS-2) is generally compatible for park use

Safety/Security: Score 1

- Emergency access available but may be difficult given location behind existing residential
- Views may be obscured and safety concerns may prevail as it faces garages/backs of homes on an alleyway and the alignment would run on the west of the park

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 3

- Low to medium costs, and would require demolition of one building on 107th Street

Site 7 - Total Score = 20

Location/Proximity: Score 5

- Adjacent to proposed station/alignment with potential for connecting access
- Within one mile of either East or West alignment option impacts

Vacancy/Availability: Score 3

- Vacant site and large acreage
- One owner to work with on acquisition per Property Appraiser database

Land Use/Zoning Compatibility: Score 3

- Current zoning – Limited manufacturing/business park(M1-1) and surrounding zoning residential (RS-2) is generally compatible for park use

Safety/Security: Score 1

- Emergency access available but may be difficult given location behind existing residential
- Views may be obscured as it faces garages/backs of homes on an alleyway and the alignment would run on the west of the park

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 5

- Low cost anticipated; additional costs may apply if existing cell tower is required to be relocated

Site 8A – Total Score = 28

Location/Proximity: Score 5

- Directly adjacent to proposed station at 111th Street
- Within one mile of either East or West alignment options

Vacancy/Availability: Score 5

- Large contiguous parcel that exceeds replacement acreage requirement
- Currently proposed as a park and ride location for RLE Project; park could be accommodated in tandem with park and ride
- Majority of property is city owned, with one additional parcel that would need to be acquired to accommodate park replacement and park and ride

Land Use/Zoning Compatibility: Score 5

- Current zoning – Limited manufacturing/business park(M1-1) and surrounding zoning residential (RS-2) and business/commercial (B1-1, C1-1) is generally compatible with park uses
- Zoning designation appears to be related to legacy uses and rezoning is compatible with current and adjacent uses
- Adjacent to existing community facilities and would enhance community center features within neighborhood

Safety/Security: Score 5

- Highly visible site location along arterial commercial corridor
- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 5

- Low cost; no building demolitions needed and city-owned acquisition anticipated

Site 9A - Total Score = 10

Location/Proximity: Score 1

- This site is located a substantial distance from the RLE corridor and stations proposed and is more than 2 miles from the area of park impact.

- Other parks available nearby and would not fulfill existing park gap

Vacancy/Availability: Score 1

- Currently a number of active commercial uses existing at or nearby the location, including the local alderman's office, restaurants, and other commercial office uses.

Land Use/Zoning Compatibility: Score 1

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1). May not provide the best compatibility for park uses and may compromise commercial redevelopment opportunities at this location.

Safety/Security: Score 3

- Highly visible site location along arterial commercial corridor

- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 1

- Risk assessed High; see EDR report for further details on potential for contamination

Cost Considerations: Score 1

- High costs due to street re-routes that would be needed to combine parcels into suitable park space; additional building demolition needed and unknown remediation costs

Site 9B – Total Score = 12

Location/Proximity: Score 1

- This site is located a substantial distance from the RLE corridor and stations proposed and is more than 2 miles from the area of park impact.

- Other parks available nearby and would not fulfill existing park gap

Vacancy/Availability: Score 1

- Currently a number of active commercial uses existing at or nearby the location, including the local alderman's office, restaurants, and other commercial office uses.

Land Use/Zoning Compatibility: Score 1

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1). May not provide the best compatibility for park uses and may compromise commercial redevelopment opportunities at this location.

Safety/Security: Score 3

- Generally visible site location near an arterial commercial corridor; set back may impede views slightly

- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 3

- Medium costs, requiring demolition of buildings and relocation of alderman's office

Site 10 - Total Score = 23

Location/Proximity: Score 3

- Located more than 2 miles from RLE Project area and area of park impacts
- Adjacent to Major Taylor Trail and would provide additional park land in this area
- Lower weighting prescribed to this site as CPD has existing plans for developing this property as parkland separately and in the near-term

Vacancy/Availability: Score 5

- Large vacant property available for purchase
- Minimal property owners for outreach on purchase

Land Use/Zoning Compatibility: Score 3

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1) is generally compatible with park uses

Safety/Security: Score 3

- Generally visible site location along existing Major Taylor Trail and residences
- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 5

- Risk assessed Low; see EDR report for further details on potential for contamination

Cost Considerations: Score 5

- Low anticipated costs. Medium level costs if additional soil remediation is needed based on field visit investigations

Site 11 - Total Score = 16

Location/Proximity: Score 1

- Located more than 2 miles from RLE Project area and area of park impacts

Vacancy/Availability: Score 3

- Under consideration by the City as a Planned Unit Development; additional coordination with city would be needed on availability of land

Land Use/Zoning Compatibility: Score 1

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1) is generally compatible with park uses

- Large parcel with commercial development potential; park use may not be best and highest use for the property and may impact ability for commercial redevelopment in corridor

Safety/Security: Score 5

- Highly visible site location along arterial commercial corridor

- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 3

- Medium costs given paved area currently existing and need to remove/relocate utilities (i.e., telephone piles and power lines) on properties

Site 12 – Total Score = 26

Location/Proximity: Score 3

- Located more than 2 miles from RLE Project area and area of park impacts
- Located near proposed 116th Street station and would allow for development of this station with co-located station as part of RLE Project

Vacancy/Availability: Score 5

- Currently vacant property and based on field investigations, one building remaining is scheduled for demolition currently

Land Use/Zoning Compatibility: Score 5

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1) is generally compatible with park uses
- Near proposed station location and park use may help to spur commercial economic development and nearby transit-oriented development potential

Safety/Security: Score 5

- Highly visible site location along arterial commercial corridor
- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 5

- Low costs anticipated. Medium level costs if additional remediation is needed to address pending demolition of building on proposed site

Site 15 - Total Score = 16

Location/Proximity: Score 1

- Located more than 2 miles from RLE Project area and area of park impacts

- Adjacent to already existing parkland and community facilities in this area are already well served by parks and amenities

Vacancy/Availability: Score 5

- One property owner (city-owned) and currently vacant land

Land Use/Zoning Compatibility: Score 1

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1) is generally compatible with park uses

- Adjacent to some manufacturing uses and may not be best compatibility of uses to incorporate parkland in this area

Safety/Security: Score 5

- Highly visible site location along arterial commercial corridor

- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 1

- Risk assessed High; see EDR report for further details on potential for contamination

Cost Considerations: Score 3

- Medium costs given that site currently consists of paved areas and based on previous manufacturing uses there is an unknown level of remediation that may be needed on the property

Site 17 - Total Score = 16

Location/Proximity: Score 1

- Located more than 2 miles from RLE Project area and area of park impacts
- Requires combination of properties to meet 1.9 acres, and does not meet CPD standards for new park

Vacancy/Availability: Score 3

- Lands are vacant and voluntary acquisition is highly probable
- Combined parcel ownership may be more cumbersome as there are at least 7 property owners associated with combined land

Land Use/Zoning Compatibility: Score 3

- Current zoning – Residential (RS-1) and surrounding zoning business and commercial (B1-1, C1-1) is generally compatible with park uses
- Located within commercial corridor and park use is not considered highest and best use of land

Safety/Security: Score 1

- Highly visible site location along arterial commercial corridor
- Clear views for police scrutiny; ease of access for emergency services

Environmental Factors (EDR): Score 3

- Risk assessed Medium; see EDR report for further details on potential for contamination

Cost Considerations: Score 5

- Low costs, no building demolition required

Attachment 5: Environmental Database Report Findings

Introduction

CWC reviewed an environmental database search report, prepared by Environmental Data Resources, Inc. (EDR), to identify listings in the databases for each of the potential park replacement sites and for properties within the search radii established in the ASTM standard. The EDR report identified each subject property in the available environmental regulatory agency databases. The EDR report also identified numerous adjoining properties in the regulatory databases. Not all of the findings present an environmental concern for the subject property due to their relative location to the subject property, direction of groundwater flow, regulatory status of no further action required, or type of reported activities. In addition, the list of orphan sites (sites reported as potentially being in the project area, but which could not be mapped due to inadequate or incomplete address information) were reviewed.

Each potential park replacement site was assigned a level of concern based on the following criteria:

- **High Concern** - Sites with known/probable soil, groundwater, or soil gas contamination that not been remediated, or where remediation was incomplete or undocumented. Other considerations include the type and mobility of any contamination, distance to the project, and groundwater impacts.

- **Moderate Concern** - Sites with known/potential soil, groundwater, or soil gas contamination and where remediation is in progress or was completed with restrictions in place, or contaminants do not appear to pose a concern for the project. Sites may also be considered a Moderate Concern based on the type and intensity of former land use (e.g., chemical manufacturers, machine shops, gas stations, laundromats), even though they did not otherwise have an environmental database listing. Sites where hazardous materials or petroleum products may have been or are stored, but where there is no known contamination associated with the property based on all available information.

- **Low Concern** - There is no evidence of hazardous materials or petroleum products having been stored onsite, and there is no known contamination associated with the property based on all available information. They may include hazardous material generator sites, sites with permitted air toxic emissions, or sites with spills or leaks that were subsequently remediated and are no longer a concern.

Site 2B (near 101st Street and Michigan Avenue)

Environmental Records Review

- **Subject Property:** The Site was not listed in any of the databases searched by EDR.

- **NPL, CERCLIS, CERCLIS NFRAP:** There are no NPL, CERCLIS, or CERCLIS NFRAP sites within 1 mile of the subject property.

Historical Records Review

- **Sanborn Maps**

  - 1911: Private residences are shown on the Site.

  - 1938, 1950, 1975: A building is shown on the Site (10131 S. Michigan Avenue, parcel 2510317016) as "Auto Sales and Service" with a capacity of 100 cars with a "Lacquer Spraying" area.

  - 1987: The "Auto Sales and Service" shares the same space with "Salem Baptist Church." The "Lacquer Spraying" area in the southeast corner of the property is still shown.

  - 1989, 1991, 2002, 2004: Property unlabeled.

- **Aerial Photographs**

  - 1938: Large building in the location of the "Auto Sales and Service" building as shown on the Sanborn map. A large building that matches the footprint of Bennett Elementary School is to the east of the Site. Residential area surrounding the property.

  - 1959: Large car lot on the property at the western adjacent corner of S. Michigan Ave and E. 101st Place, across from the “Auto Sales and Service” building.
  - 1973: The car lot is larger than shown in the 1959 aerial photograph, now spanning from E. 101st Street to E. 102nd Street along the western side of S. Michigan Ave and on the parcels to the north of the “Auto Sales and Service” building to E. 101st Street.
  - 1978: Further expansion of the car lot, with car lot added to the adjacent parcels to the south of the “Auto Sales and Service” building to E. 102nd Street.
  - 1983: All the car lots are now abandoned with the exception of the lot on the corner of E. 102nd St and S. Michigan Street.
  - 1993: Lots north and south of the “Auto Sales and Service” property is empty and building appears to be demolished. Car lots have reappeared on lots located across S. Michigan Street ranging from E. 101st Street to E. 102nd Street.

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 3B (near 103rd Street and Eggleston Avenue)

Environmental Records Review

- **Subject Property**
    - A parcel associated with the Site (403 W. 103rd Street, parcel 2516105035) is listed in the CDPH environmental dataset with complaints. The EDR Report does not provide additional details about the CDPH records.
    - A parcel associated with the Site (405 W. 103rd Street, parcel 2516105034) is listed in the CDPH environmental dataset for Asbestos and Demolition Notifications. The EDR Report does not provide additional details about the CDPH records.
    - A parcel associated with the Site (405 W. 103rd Place, closest parcel number is 2516107010) is listed in the CDPH environmental dataset with complaints. The EDR Report does not provide additional details about the CDPH records.
- **Nearby Properties**
    - The Roseland Pumping Station (0.036 mile southeast of the subject property at 351 W. 104th Street) has active air monitoring for compliance and is under the State Implementation Plan for National Primary and Secondary Ambient Air Quality Standards. The latest results were in 2014, and the site was monitored for NOx, Particulates, PM10, PM 2.5, SO2, VOM, CO2, CO, CF4, and COG.
- **NPL, CERCLIS, CERCLIS NFRAP:** There are no NPL, CERCLIS, or CERCLIS NFRAP sites within 1 mile of the subject property.

Historical Records Review

- **Sanborn Maps**
    - 1911: Coal shed and railroad spur located in northern portion of Site (400 W. 103rd Place, parcel 2516105033).
    - 1938: Fuel storage added to the central portion of the Site (401 W. 103rd Place, parcel 251610701). Fuel warehouse added to northern portion of Site (403 W. 103rd Street, parcel 2516105035).

  - 1950: Coal yard has expanded to southern portion of Site, next to the Fuel Storage area.

  - 1975: A construction yard is present on the southern portion of Site (401 W. 103rd Place, parcel 2516107010). The fuel storage and coal yard are no longer present.

  - 1987: The construction yard has transitioned to a junk yard. The fuel warehouse is no longer present.

  - 2002: The Site is mostly vacant with the exception of residences in the northern portion (403 and 405 W. 103rd Street, parcel numbers 2516105035 and 2516105034). The railroad spur is no longer present.

- **Aerial Photographs**

  - 1938: Site appears to be darker than surrounding properties.

  - 1964: There appears to be three or four aboveground storage tanks (ASTs) on the southern portion of the Site (parcel 251610701).

  - 1978: A junk yard can be seen in the 1978 aerial photograph. Debris spans a large portion of the Site (parcels 251610701 and 2516105033). The debris is last seen in the 1994 aerial photograph. The junk yard area is vacant in the 1999 aerial photograph.

  - 2007, 2009, 2010, 2011, 2012: Junk yard area has miscellaneous debris.

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 6

Environmental Records Review

- **Subject Property**
  - The southern portion of Site (400 W. 107th Street, parcel 2516129028) is listed in the CDPH environmental dataset was records of enforcement, inspections, and tanks. The EDR Report does not provide additional details about the CDPH records.
- **Nearby Properties**
  - The adjacent parcel to the north (411 W. 105th Street, parcel 251612024 [listed as 413 W. 105th Street in the EDR Report]) is listed as the Illinois Bell Telephone Company, a RCRA Non-Generator site.
  - The Roseland Pumping Station (0.187 mile north of the subject property at 351 W. 104th Street) has active air monitoring for compliance and is under the State Implementation Plan for National Primary and Secondary Ambient Air Quality Standards. The latest results were in 2014, and the site was monitored for NOx, Particulates, PM10, PM 2.5, SO2, VOM, CO2, CO, CF4, and COG.
- **NPL, CERCLIS, CERCLIS NFRAP:** There are no NPL, CERCLIS, or CERLCIS NFRAP sites within 1 mile of the subject property.

Historical Records Review

- **Sanborn Maps**
  - 1950: A “Cement Block Factory” with several tanks is located on the central portion of the Site (10638 S. Stewart Avenue, parcel 2516129030). A railroad spur is shown running along the east side of the building.

- 2002: The Site is mostly vacant, with only one building on the southern portion of the Site (400 W. 107th Street, parcel 2516129028).

- **Aerial Photographs**
  - 1964: Potential ASTs (possibly the slag bin/tanks referenced in the Sanborn Maps) appear behind the building on the central portion of the Site.
  - 1984: There appears to be debris on southern portion of Site (400 W. 107th Street, parcel 2516129028).
  - 2007: Miscellaneous small containers are located on the property to the north of the Site (411 W. 105th Street, parcel 2516121024).

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 7

Environmental Records Review

- **Subject Property**
  - The northern portion of the Site (405 W. 107th Street, parcel 2516307025) was listed in the CDPH environmental dataset as having records of permits. The EDR Report does not provide additional details about the CDPH records.
  - The northern portion of the Site (407–411 W. 107th Street) was listed in the CDPH environmental dataset with records of complaints and inspections. The EDR Report does not provide additional details about the CDPH records.
  - A portion of the Site (401–411 W. 107th Street), described as a vacant lot, is listed in the Bureau of Land database.
- Nearby Properties
  - The adjacent property to the south (410 W. 109th Street, parcel 2516315024) has a history of auto stations (listed as Harris Transmission Company from 1999–2002).
- **NPL, CERCLIS, CERCLIS NFRAP:** There are no NPL, CERCLIS, or CERLCIS NFRAP sites within 1 mile of the subject property.

Historical Records Review

- **Sanborn Maps**
  - 1939: A “coal yard” and railroad spur are located on the Site (parcels 2516315027, 2516315025, and 2516307022). An additional “coal yard” is located across the train tracks

from the Site to the east, east (347 W. 107th Place, parcel 2516401001).

- ○ 1989-2004: The coal yard is no longer shown. The railroad spur is still present on the Site.

- **Aerial Photographs**
  - ○ 1938: The Site appears to be darker than the surrounding properties. The coal yard to the east also appears darker.
  - ○ 1984: The Site appears to be covered by debris.
  - ○ 1988: Miscellaneous debris is shown on the central portion of the Site (405 W. 108th Street, parcel 25163150250).
  - ○ 1999: Miscellaneous debris is shown on the property south of the Site (410 W. 109th Street, parcel 25163150240).

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 8 (near Eggleston Avenue and 111th Street)

Environmental Records Review

- **Subject Property**
    - A parcel within the Site is listed with complaints and inspections in the CDPH environmental dataset (401 W. 110th Street, parcel 2516329006). The EDR Report does not provide additional details about the CDPH records.
- **Nearby Properties**
    - The adjacent property to the south of the Site (Chicago Dept of Env (Spill) at 11100 S. Stewart Avenue, no parcel number given) is listed as a RCRA Non-Generator site. This may be an error; on Google Maps the property (Roseland Tune-Up Center, 401 W. 111th Street, parcel 2521107008) is an auto station and LUST site (located 0.033 mile south).
    - The adjacent parcel to the south of the Site (Pentecostal Temple at 419 W. 111th Street, 0.016 mile south-southwest from Site, parcel 2521107001) is an active LUST site. The EDR Report does not provide additional details about the LUST site. Pentecostal Temple is also a RCRA-SQG.
    - Ransom Transportation (352 W. 110th Street, parcel 25164190140, 0.033 mile northeast of the Site) is a RCRA-CESQC and an active LUST site. The EDR Report does not provide additional details about the LUST site.
- **NPL, CERCLIS, CERCLIS NFRAP:** There are no NPL, CERLCIS, or CERCLIS NFRAP sites located within 1 mile of the Site.

Historical Records Review

- **Sanborn Maps**
    - 1897: The northern portion of the Site (412 W. 109th Street, parcel 2516320023) is shown as “Roseland Manufacturing Corporation (closed).” A “Wood and Coal Yard” with two coal sheds is shown on the southern portion of Site (11037 and 41 S. Eggleston Avenue, parcel 2516329009, and 2516329008). The warehouse for “Roseland Manufacturing Co. Warehouse” is shown on the southern portion of the Site (402 E. 111th Street, parcel

2516329005).

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 9A (near 111th Place and State Street)

Environmental Records Review

- **Subject Property**
    - A parcel in the southern portion of the Site (24 E. 112th Street, parcel 2522101023) is listed in the CDPH environmental dataset for Asbestos and Demolition Notifications and inspections. The EDR Report does not provide additional details about the CDPH records.
    - A parcel in the southern portion of the Site (12 E. 112th Street, parcel 2522101018) has a record of historical cleaners. (Neals Laundromat, 2006)
    - A parcel in the southern portion of the Site (14 E. 112th Street, parcel 2522101019) is listed in the CDPH environmental dataset with records of complaints and inspections. The EDR Report does not provide additional details about the CDPH records.
    - A parcel in the southern portion of the Site (34 E. 112th Street, parcel 2522101027) is listed in the CDPH environmental dataset with records of inspections. The EDR Report does not provide additional details about the CDPH records.
    - A parcel in the southern portion of the Site (16 E. 112th Street, parcel 2522101020) is listed in the CDPH environmental dataset with records of complaints, Asbestos and Demolition Notifications, and inspections. The EDR Report does not provide additional details about the CDPH records.
- **Nearby Properties**
    - Amoco (0.009 mile north-northwest of the Site at 2 W. 111th Place, parcel 2521203025), is listed as a RCRA Non-Generator with waste characterized as “ignitable waste” and “benzene.”
    - Roseland Marathon (0.073 mile north-northwest of the Site at 2 W. 111th Street, parcel 2516430043) is an active LUST site. The EDR Report does not provide additional details about the LUST site. The EDR Report states that there are several other USTs on this property.
- **NPL, CERCLIS, CERCLIS NFRAP**
    - 109th Place Tear Gas is a CERCLIS site located 0.237 mile north of the Site (the address is shown in the EDR Report as “SG West 109th Place”).
    - There are no NPL or NFRAP CERCLIS sites located within 1 mile of the Site.

Historical Records Review

- **Sanborn Maps**

    - 1897: “Roseland Bottling Works” is shown on the western parcel of the Site (6 E. 111th Street, parcel 2522100012). In 1911, there appears to be a tank (illegible label) within the “Bottling Works” business.

    - 1939: An auto repair business is located in northwestern portion of Site (6 E. 111th Street, parcel 2522100012). A parking garage is located on northern portion of Site (32 E. 111th Street, parcel 2522100027). A filling station is located in the adjacent parcel to the north (1 E. 111th Street, parcel 2522100028). Several automotive businesses are shown in adjacent parcels to the north.

    - 1938: Coal yard referenced in Sanborn map present in the aerial photograph.
    - 1952: Central portion of the Site appears to be vacant.
    - 1959: Large building that is referenced in the 1989 Sanborn map is seen in the aerial photograph.
    - 2007: Large building has been demolished. The Site is vacant with the exception of a cluster of buildings in the northwestern corner of the Site.
    - 2012: Site is completely vacant.

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 12 (near Michigan Avenue and Kensington Avenue)

Environmental Records Review

- **Subject Property**
    - Northwestern parcel of the Site (Clark Oil and Refining, 11555 S. Michigan Avenue, parcel 2522304050) is a historical LUST site. The Site received an NFA/NFR letter on January 9, 1995. This parcel also appears in the IL SPILLS and IL BOL database as a LUST site.
- **Nearby Properties**
    - Tony's Auto Body, in the adjacent parcel to the north (0.047 mile to the northeast of the Site, 157 E. Kensington Avenue, parcel 2522304022) is listed in the RCRA-CESQG database with waste characterized as "ignitable waste." This parcel is also listed as a historical auto station.
    - Kensington Service Station (0.055 mile northeast of the Site at 162 E. Kensington Avenue, parcel 2522301044) is an active LUST site. There is no NFA/NFR letter associated with the LUST.
    - An active LUST station, identified as "Abandoned Gas Station," is located 0.177 mile northwest of the Site at 2 W. 115th Street, parcel 252123003. There is no NFA/NFR letter associated with the LUST.
    - Triangle Transmission (0.208 mile northwest of the Site at 35 W. 115th Street, parcel 2521230023 [closest parcel number]) is an active LUST site. There is no NFA/NFR letter associated with the LUST.
    - A US Brownfields site is located 0.258 mile north-northwest of the Site at 3 W. 114th Street. The property is suspected to be an abandoned service station, and is owned by the City of Chicago. The EDR Report provides no additional information.
- **NPL, CERCLIS, CERCLIS NFRAP:** There are no NPL, CERLCIS, or CERCLIS NFRAP sites located within 1 mile of the Site.

Historical Records Review

- **Sanborn Maps**
    - 1897: "R.A. Viall Feed Mill Coal and Wood" located on southwestern corner of the Site (11579 S. Michigan Avenue, parcel 2522304008). Kensington Station located on adjacent

parcel to the southwest (11583 S. Michigan Avenue, parcel 2522304009).

- **Aerial Photographs**
  - 1938: Yard that appears to have the same footprint as “R.A. Viall Feed Mill Coal and Wood” referenced in the Sanborn maps is present in the aerial photograph.

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Site 15 (1000 E. 118th Street)

Environmental Records Review

- **Subject Property**
    - The Site (1000 E. 118th Street, parcel 2520414006) is listed in the CDPH environmental dataset as having tanks. The EDR Report does not provide additional details about the CDPH records.

- **NPL, CERCLIS, CERCLIS NFRAP**
    - Ingersoll, adjacent to the Site, at 1000 W. 120th Street, parcel 2529203003 [closest parcel number]) is a CERLIS site. The CERLIS site has a “Removal Only Site (No Site Assessment Work Needed” as is a non-NPL site. The property is also listed as a RCRA-NonGen with waste characterized as “quenching bath residues from oil baths” and “spent cyanide solutions.”

    - Former West Pullman Works, adjacent to the Site, at 1015 W. 120th Street (parcel 2529203003) is a CERCLIS site. The CERCLIS site shares the same parcel as the Ingersoll business above. The CERCLIS site has the following description: “Abandoned 21-acre site with high levels of PAHs, heavy metals, and asbestos.” This property is also listed as a RCRA-NonGen with many waste characterizations. The same property is also listed under “International Harvester – Former West Pullman Works” as a former LUST site; an NFA/NFR letter was received in November 2010.

    - West Pullman Iron and Metal (located 0.156 mile southeast of the Site at 11954 S. Peoria Street, parcel 2529201021) is a CERCLIS NFRAP site. The site was archived in October 1995.

    - Dutch Boy (located 0.213 mile east-southeast of the Site at 12042 S. Peoria Street, parcel 2529203002 [closest parcel]) is a CERCLIS site. The site description states that it is associated with the International Harvester business mentioned above. The site was given NFRAP status in December 1984.

Historical Records Review

- **Sanborn Maps**
    - 1911: Site was a portion of the larger “West Pullman Car Works, Morgan Street Yards” facility. There is a paints and oils storage and locomotive storage building in the northern

portion of the Site.

- **Aerial Photographs**
  - 1952: Southern portion of the Site appears to be used as a parking lot.
  - 1959: The Site is paved entirely, there are no buildings on the Site. There appears to be miscellaneous debris on the western boundary of the Site.
  - 1962: The southern portion of the Site is being used as a parking lot.
  - 1988: There are two pools on the northern portion of parking lot. This could be the result of stormwater.
  - 2005: The northern portion of the Site is overgrown.

Environmental Concern Rating: High Concern

- Hazardous materials or petroleum products may have been stored onsite, and proximity to historic release sites indicate a high concern.

Site 17 (near 120th Street and Halsted Street)

Environmental Records Review

- **Subject Property**
    - Parcel 2528108036 associated with the Site (12048 S. Emerald Avenue) is listed in the CDPH environmental dataset with complaints, Asbestos and Demolition Notifications, and inspections. The EDR Report does not provide additional details about the CDPH records.
    - Parcel 2528108032 associated with the Site (12034 S. Emerald Avenue) is listed in the CDPH environmental dataset with complaints and inspections. The EDR Report does not provide additional details about the CDPH records. The same parcel is listed as a historical auto station (Mack's Auto Styling, 1999-2001).
    - Parcel 2528109001 associated with the Site (725 W. 120th Street) is listed as a historical cleaner.
- **Nearby Properties**
    - Hancock House (located 0.007 mile southeast of the Site at 12045 S. Emerald Avenue, parcel 2528109010) has five active USTs. The site is an active LUST site. The LUST does not have a NFA/NFR letter. There is an Illinois Institutional Control on this property that received an NFR letter in January 2012.
    - A property identified as ComEd Manhole (located 0.032 mile northwest of the Site at the intersection of W. 120th Street and S. Halsted Street [EDR does not provide a specific address]) is a RCRA Non-Gen with waste characterized as "lead."
    - Conoco Phillips 66 (located 0.062 mile north-northwest of the Site at 11959 S. Halsted Street, parcel 2528100011) has five active USTs. The same property is listed as Sandhu Petroleum Inc., (located at 11957 S. Halsted Street) is an active LUST site. The LUST has not received an associated NFA/NFR letter.
- **NPL, CERCLIS, CERCLIS NFRAP**
    - South Green Plating Shop (located 0.124 mile southwest of the Site at 12130 S. Green Street, parcel 2529209047) is a CERCLIS site. The CERCLIS site is described as a "former plating shop with elevated levels of cyanide, chromium, cadmium, and lead contamination." The site has a Non-NPL status of "Removal Only Site (No Site Assessment Work Needed." The site is also listed as a RCRA Non-Gen with waste characterized as "ignitable/corrosive waste" and "lead."
    - Dutch Boy Paints (located 0.155 mile west of the Site at 12042 S. Peoria Street, parcel 2529203002 [closest parcel]) is a CERCLIS site. The site is associated with the International

Harvester Site which is described to be associated with the Former West Pullman Works, which has a description of “Abandoned 21 acre site with high levels of PAHs, heavy metals, and asbestos.”

- West Pullman Iron and Metal (located 0.157 mile west-northwest of the Site at 11954 S. Peoria Street, parcel 2529201021) is a CERCLIS NFRAP site. The site was archived in October 1995.
- There are no NPL sites within 1 mile of the subject property.

Historical Records Review

- **Sanborn Maps**
  - 1911: The central adjacent parcel (12045 S. Emerald Avenue, parcel 2528109010) is labeled as a coal shed in the northern portion and a “cement block wks” in the southern portion. A railroad spur also runs across this parcel.
  - 1939: The parcels surrounding parcel 2528109003 (721 W. 120th Street) associated with the Site are labeled as Lundquist Coal Company Coal Yard. There is a parking garage in the southeastern portion of the Site (12054 S. Union Avenue, parcel 25281090250). Sheet Metal Works business is located at the central portion of the Site (12034 S. Emerald Avenue, parcel 2528108032). The central adjacent parcel (12045 S. Emerald Avenue, parcel 2528109010) is now labeled as Spencer Petroleum Company, with several tanks.

  - 1950: Central adjacent parcel (12045 S. Emerald Avenue, parcel 2528109010) is now labeled as “Bulk Oil Storage (Not in Operation).”

  - 1989: Central adjacent parcel (12045 S. Emerald Avenue, parcel 2528109010) is now vacant. Sheet metal business and Lundquist Coal Company is no longer on Site. Landscaping material yard established in western adjacent parcel (12029 S. Halsted Street, parcel 2528108041). No significant changes to last Sanborn available in 2004.

- **Aerial Photographs**

  - No significant findings from the aerial photographs.

Environmental Concern Rating: Medium Concern

- Hazardous materials or petroleum products may have been stored onsite, but there is no known contamination associated with the property based on all available information.

Attachment 6: Park Concept Renderings

Note that appearance of project elements (such as park amenities, trees, landscaping, pathways, etc.) in visualizations is intended to show scale of project elements. Actual placement and construction appearance may differ based on design decisions for colors, textures, finishes, and choice of specific features.
